## Summary

This manual describes the use of and relevant equations programmed in a computer code designed to carry out a comprehensive linear analysis of multilayered fiber composites. The analysis contains the essential features required to effectively design structural components made from fiber composites. The program is an outgrowth of two in-house computer codes, MFCA (Multilayered Filamentary Composite Analysis) and INHYD (Intraply Hybrid Composite Design). The inputs to the code are constituent material properties, factors reflecting the fabrication process, and composite geometry. The code performs micromechanics, macromechanics, and laminate analysis, including the hygrothermal response of fiber composites. The code outputs are the various ply and composite properties, composite structural response, and composite stress analysis results with details on failure. The code is in Fortran IV and can be used efficiently as a package in complex structural analysis programs. The input-output format is described extensively through the use of a sample problem. The code manual consists of two parts. The mechanics for using the code are described in the first part, the pertinent equations programmed in the code are described in the second part.

## Introduction

The importance of and need for a multilevel analysis used for designing structural components made of multilayered fiber composites are documented in reference 1. A multilevel analysis, which was efficient in predicting the structural response of multilayered fiber composites (with the constituent material properties, the fabrication process, and the composite geometry known), is also documented in reference 1.

The multilayered analysis presented in reference 1 consists of (1) micromechanical theories for the thermoelastic properties and the stress-level limit of the single ply as functions of constituent material properties and the particular fabrication process, (2) the combined stress-strength criterion for the single ply, and (3) multilayered composite structural response and analysis (macromechanical or laminate analyses), where the interply layer effects are taken into account. A computer code designed to carry out this multilevel analysis, supplemented as noted by references 2 to 10, has been developed at the Lewis Research Center. This code is identified as MFCA for Multilayered Filamentary Composite Analysis (ref. 11).

Intraply hybrid composites are a logical sequel to conventional and interply hybrid composites. Recently, theoretical and experimental investigations have been conducted on the mechanical behavior of intraply hybrids at the Lewis Research Center (refs. 12 to 14). The theoretical methods and equations described in these references, together with those for hygrothermal effects (ref. 15), have been integrated into a computer code for predicting hygral, thermal, and mechanical properties of intraply hybrid composites. This information can then be used in designing these composites. This code is identified as INHYD for Intraply Hybrid Composite Design (refs. 16 and 17).

The present computer code is a synergistic combination of the aforementioned computer programs MFCA and INHYD together with several significant enhancements. The code is referred to as ICAN for Integrated Composite Analyzer. It utilizes the micromechanical design of INHYD and the laminate analysis of MFCA to build a comprehensive analysis capability for structural composites. Additional features unique to ICAN are the following:

- (1) Ply stress-strain influence coefficients
- (2) Microstresses and microstress influence coefficients
- (3) Stress concentration factors around a circular hole
- (4) Calculation of probable delamination locations around a circular hole
- (5) Poisson's ratio mismatch details near a straight free edge
- (6) Free-edge stresses
- (7) Material cards for finite-element analysis using NASTRAN or MARC
- (8) Failure loads, summary based on the maximum stress criterion and laminate failure stresses, and summary based on first-ply failure and fiber breakage criteria
- (9) Transverse shear stresses and normal stresses

In addition to the above, ICAN has its own data base of material properties for commonly used fibers and matrices. The user needs to specify only the coded names for the constituents. The program searches and selects the appropriate properties from its library. Furthermore, input data preparation has been simplified substantially by the introduction of a partial free-field format. The output formats have also been improved significantly to ease user interpretation of the results. These enhancements make ICAN significantly more user friendly than its predecessors. The computer code has been programmed in Fortran IV and has been tested in UNIVAC 1108, IBM 370, and CRAY 1 computers.

Since this report is to serve as a users manual, the code is divided into two parts, the users manual and the programmers manual. The Users Manual describes the mechanics of using the code with respect to program format, input and output, and sample input data sets. The descriptions are extensive enough so that even designers and analysts with little or no programming experience can easily use the code.

The programmers manual gives the various subroutine descriptions and the equations programmed therein, with details on the input and output and the global storage locations. This, along with the listing of the source program, allows the user to make his own modifications to the code as they become appropriate for further enhancements.

The Fortran variables are defined in appendix A. Included is information such as which part of the program of each global variable is generated. Table I provides a summary of details for preparing data cards, and the input data given in table II provide for immediate testing of the code. Properties for a few commonly used fibers and matrix materials are listed in appendix B. Appendix C shows sample input and output data for a specific case.

## Symbols

$A_{cx}$	composite axial stiffness
$A_{cx}^R$	reduced axial stiffness
BIDE	boolean, true if interply effects are included
$C_{cx}$	composite coupling stiffness
$C_{e1}$	string with force variables
$C_{e2}$	string with displacement variables
COMSAT	boolean, true if laminate analysis is wanted
CSANB	boolean, true if membrane and axial symmetry exists
$D_c, D_\ell$	moisture diffusivity
$D_{cx}$	composite flexural rigidity
$D_{cx}^R$	reduced bending rigidity
$\mathbf{D}_v$	displacement vector
$d_f$	filament equivalent diameter
$E_f, E_{cf}$	filament elastic constants
$E_{f11}$ , etc.	fiber normal modulus
$E_\ell, E_{cl}$	ply elastic constants

$E_{\ell 1}$ , etc.	ply normal modulus
$E_m, E_{cm}$	matrix elastic constants
$E_{m11}$ , etc.	matrix normal modulus
$\varepsilon_{m,etc}$	matrix failure strain allowables
$F$	combined stress-failure function
$G_{f12}$ , etc.	fiber shear modulus
$G_{\ell 12}$ , etc.	ply shear modulus
$G_{m12}$ , etc.	matrix shear modulus
$H_j$	interply distortion energy coefficient
$H_{kc}$	array of constituent heat conductivities
$h_c$	composite heat capacity
$i,j$	index, generally ply or interply
$K_{c11,c22,c33}$	composite three-dimensional heat conductivities
$K_{cxy,cyy,cxy}$	composite two-dimensional heat conductivities
$K_{f11}$	fiber heat conductivity
$K_{\ell 11}$	ply heat conductivity
$K_{m11}$	matrix heat conductivity
$k_v$	apparent void volume ratio
$k_f$	actual fiber volume ratio
$k_{f\ell}$	ply apparent fiber volume ratio
$k_m$	actual matrix volume ratio
$k_{ml}$	ply apparent matrix volume ratio
$k_{v\ell}$	ply apparent void volume ratio
$L_{sc}$	array of limiting conditions
$M_\ell$	ply moisture
$M_{cx}$	applied moment
$M_{cM_\ell x}$	hygral moment
$M_{cT_\ell x}$	thermal moment
$m$	load condition index
$N_{cx}$	applied membrane loads
$N_{cM_\ell x}$	hygral force
$N_{cT_\ell x}$	thermal force
$N_f$	number of fibers per end
$N_\ell$	number of plies
$N_{\ell c}$	number of load conditions
NONUDF	boolean; true if detailed Poisson's ratio differences chart is to be suppressed
$N_{pc}$	string PROPC length
$N_{pl}$	string PROP length
$P_c$	composite properties array
$P_{cp}$	string PROPC
$P_\ell$	ply properties array
$P_{\ell p}$	string PROP main program
$Q_{f,i,p,r,s}$	indices to print out string PROP
$R$	transformation matrix
RINDV	boolean; true if displacements are known

$S_c$	composite failure stress
$S_{\ell 1T}$ , etc.	ply limit failure stresses
$T_\ell$	ply temperature
$t_\ell$	ply thickness
$w_{cb}$	composite local curvature changes
$x, y, z$	structural reference axes
$\alpha_c$	composite coefficient of thermal expansion
$\alpha_f$	fiber thermal coefficient of expansion
$\alpha_\ell$	ply thermal coefficient of expansion
$\alpha_m$	matrix thermal coefficient of expansion
$\beta_c$	moisture expansion coefficients
$\beta_e, \beta_\epsilon$	correlation factors for ply thermoelastic properties
$\beta_h$	correlation factor for ply heat conductivity
$\beta_\ell, \beta_f, \beta_m$	moisture expansion coefficients for ply, fiber, and matrix
$\beta_s$	correlation factor for ply strength
$\beta_v$	matrix strain magnification due to ply strain in the presence of voids
$\delta_f$	interfiber spacing
$\delta_\ell$	interply layer thickness
$\delta_s$	interfiber spacing
$\epsilon_{cs}$	angle between composite material and structural axes
$\epsilon_{csx}$	reference plane membrane strain
$\epsilon_\ell$	ply strain
$\theta_\ell, \theta_c$	angle between ply material and composite axes
$\nu_{f12}$ , etc.	fiber Poisson's ratio
$\nu_{\ell 12}$ , etc.	ply Poisson's ratio
$\nu_{m12}$ , etc.	matrix Poisson's ratio
$\rho_{f,m}$	fiber and matrix weight density
$\rho_{mw}$	density of matrix with moisture
$\sigma_\ell, \sigma_f, \sigma_m$	ply stresses, fiber stresses, and matrix stresses
1, 2, 3	material reference axes

## Users Manual

The mechanics required to use this code for the analysis of multilayered fiber composites are described in this part of the report. The theory on which the code is based is described in the second part of the report (Programmers Manual).

The physical representations of the constituents used in the code are illustrated in figure 1. This figure shows a complete integration schematic starting with the constituent materials, fiber and matrix. The required input properties and computed properties at various levels are summarized in symbolic form as follows:

(1) Properties required by code as input for a fiber:  $E_{f11,22,33}$ ;  $\nu_{f12,23,13}$ ;  $G_{f12,22,13}$ ;  $\alpha_{f11,22,33}$ ;  $K_{f11,22,33}$ ;  $H_{cf}$ ;  $\rho_f$ ;  $N_f$ ;  $d_f$ ; and  $S_{ft}$ .

(2) Properties required by code as input for a matrix:  $E_{m11,22,33}$ ;  $\nu_{m12,23,13}$ ;  $G_{f12,23,13}$ ;  $\alpha_{m11,22,33}$ ;  $K_{m11,22,33}$ ;  $H_{cm}$ ;  $\rho_m$ ;  $S_{mc}$ ;  $\varepsilon_{mpt}$ ;  $\varepsilon_{mpc}$ ;  $\varepsilon_{mps}$ ; and  $\varepsilon_{mpTOR}$ .

(3) Properties required by code as input for a single ply: fiber and matrix properties and ply characteristics  $\beta_e$ ,  $\beta_n$ ,  $\beta_s$ , and  $T_\ell$ .

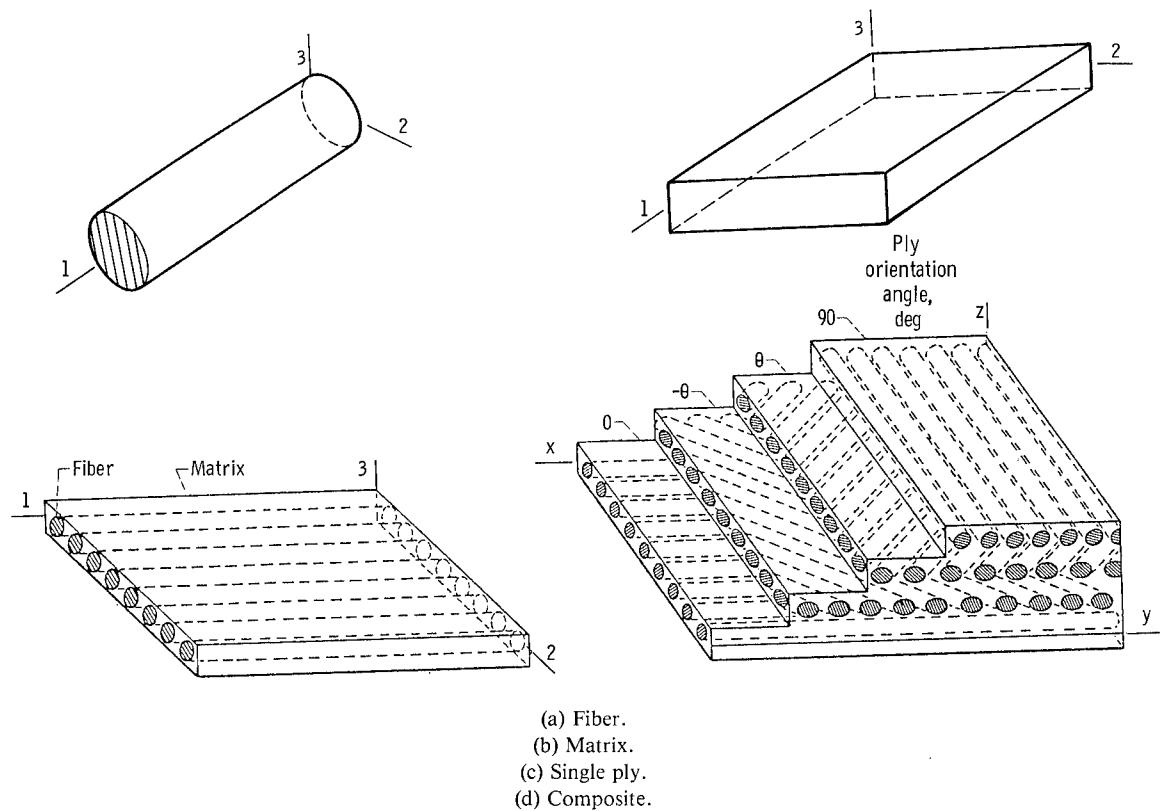

Figure 1.—Schematic of typical multilayered fiber composite and some basic components.

(4) Properties computed by code for single ply:  $E_{\ell11,22,33}$ ;  $\nu_{\ell12,23,13}$ ;  $G_{\ell12,23,13}$ ;  $\alpha_{\ell11,22,33}$ ;  $K_{\ell11,22,33}$ ;  $H_{c\ell}$ ;  $\rho_{\ell}$ ;  $t_{\ell}$ ;  $\delta_{\ell}$ ;  $S_{\ell11T,11C,22T,22C,12S,23S}$ ;  $K_{\ell12}$ ; and stress analysis factors  $\epsilon_{\ell11,22,12}$ ;  $\sigma_{\ell11,22,12}$ ; and  $1.0 - F(\sigma, S, K_{\ell12})$ .

(5) Properties required by code as input for a composite: ply properties and composite characteristics  $\theta_{ij}$ ,  $H_j$ ,  $K'_{12\alpha\beta}$ ,  $N_{cx}$ ,  $M_{cx}$  or  $U_{cx}$ , and  $W_{cx}$ .

(6) Output computed by code for a composite:  $\{\epsilon_{cx}\} = [E_c]\{\sigma_c\} + T_\ell\{\alpha_c\}; [E_c]^{-1}; K_{cxy,yy,xy}; H_c$

$$\begin{pmatrix} N_{cx} \\ M_{cx} \end{pmatrix} = \begin{bmatrix} A_{cx}C_{cx} \\ C_{cx}D_{cx} \end{bmatrix} \begin{pmatrix} U_{cx} \\ W_{cx} \end{pmatrix} + \begin{pmatrix} N_{cxT_e} \\ M_{cxT_e} \end{pmatrix}$$

and the inverse  $\Delta\varphi_{\text{delj.}}$

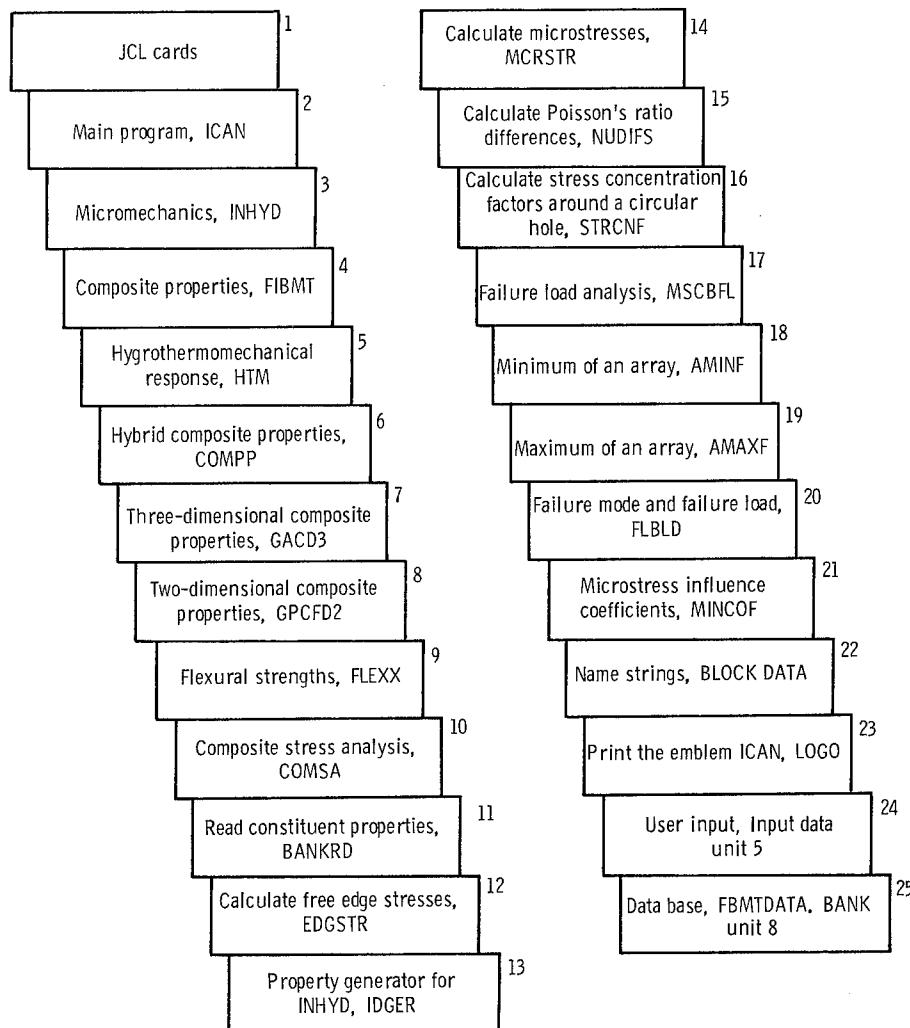

Figure 2(a) shows the subroutines and sequence in the code. The subroutines between the Main program and the input data may be arranged in any desired order. The user should refer to figure 2(b) for the logic flow of the analysis.

The following four steps are required to use the code in the user's computer facility:

- (1) Obtain the code
- (2) Make it operational in the user's computer facility
- (3) Supply the input data
- (4) Interpret the code output results

## Obtain the Code

The code may be obtained in cards. If this is not convenient or possible, the cards can be punched from the compiled listing (contact COSMIC, The University of Georgia, Athens, GA 30602, concerning the availability of this program).

(a) Schematic showing subroutines and sequence of ICAN code.

Figure 2.—Subroutines, sequence, and logic flaw of ICAN code.

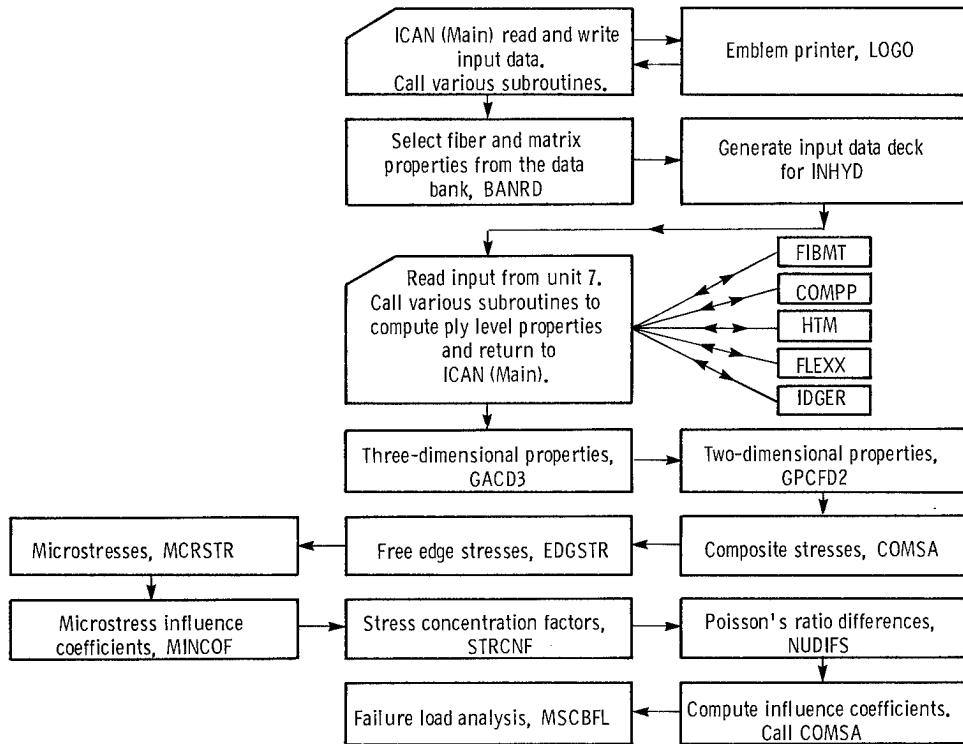

### Make it Operational

A prerequisite to the program is the availability of a Fortran compiler in the user's computer facility. To run the program, certain computer-system-dependent control cards (Job Control Language (JCL) cards) may also be necessary. The computer system personnel should be consulted about these items.

Once the deck of cards has been assembled (except input data) with the proper control cards as shown in figure 2, the user is ready to compile the code in his facility. The compilation will indicate whether any additional modifications are needed. Most modifications will be minor and will usually deal with certain Fortran statements peculiar to each compiler.

### Supply the Input Data

The physical arrangement of the input data cards is illustrated in figure 3. Details for preparing the input data cards are summarized in table I. A detailed description of these cards is given subsequently. A sample for preparing input data for a four-ply symmetric laminate is presented in table II. This laminate has two different material systems. The  $0^\circ$  plies are of AS graphite fiber/intermediate-modulus, low-strength epoxy matrix composite. The  $90^\circ$  plies are made of a hybrid composite. The primary composite is S glass/high-modulus, high-strength epoxy. The secondary composite is AS graphite/intermediate-modulus, high-strength epoxy.

(b) Schematic showing logic flow of ICAN code.

Figure 2.—Concluded.

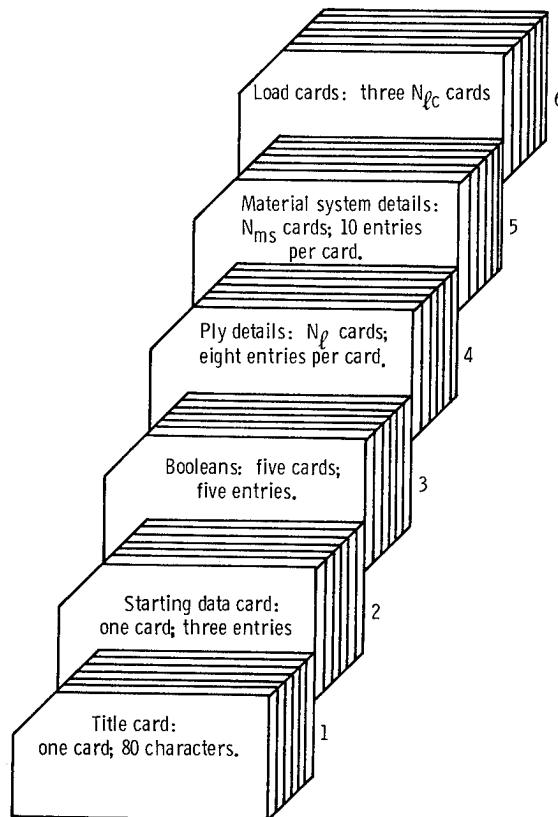

Figure 3.—Physical arrangement of input data cards.

TABLE I.—SUMMARY OF DETAILS FOR PREPARING INPUT DATA CARDS

Card group	Identification	Code symbol	Number of entries	List of entries, sequential order	Card field columns	Format	Comments and engineering units
1	Title card	TITLE	80	Alphabetic characters	1 to 80	(10a8)	
2	STDATA	NL,NLC,NMS	3	$N_l, N_{lc}, N_{ms}$	9 to 36	(a8,3I8)	Composite geometrics
3	Boolean for input displacement	RINDV	1	-----	1 to 6	-----	T (true) if displays are inputs; otherwise F (false)
	Boolean for interply layer energy contribution	BIDE	1	-----	1 to 6	-----	T (true) if contributions are desired; otherwise F (false)
	Boolean for membrane and bending symmetry	CSANB	1	-----	1 to 6	(L6)	T (true) if symmetry exists; otherwise F (false)
	Boolean for laminate analysis	COMSAT	1	-----	1 to 6	-----	T (true) if laminate analysis is desired; otherwise F (false)
	Boolean for Poisson ratio chart	NONUDF	1	-----	1 to 6	-----	T (true) if Poisson ratio differences chart is not desired; otherwise F (false)
4	PLY (ply desired)	INP1,IP1,TU,TCU DELM,TETA,THCKNS	7	$i, j, T_u, T_{cu}, \Delta M, \theta_l, t_l$	1 to 64	(a8,2I8,5F8.3)	Ply layup and temperature and moisture conditions
5	MATCRD (material system details)	CODES(1,1,J), CODES(1,2,J), VFP,VVP, CODES(2,1,J), CODES(2,2,J), VFS,VVS,VSC	9	Primary composite code names for fiber and matrix, $k_f, k_v$ Secondary composite code names for fiber and matrix, $k_{sc}, k_f, k_v$	1 to 64	(a8,2a4,2E8.2)	Description of material systems to be used
6	PLOAD (loading details)	NX,NY,NXY,THCS MX,MY,MXY  DMX,DMY PRSSU,PRSSL	4 3  4	$N_x, N_y, N_{xy}, \theta_{cs}, M_x, M_y, M_{xy}$ $dM_x/dx, dM_y/dy, P_u, P_l$	1 to 32 1 to 32  1 to 40	(a8,7E8.4) (a8,7E8.4)  (a8,7E8.4)	Loading conditions (inplane) Angle of inclination to the structural x-axis Loading conditions (bending) Loading conditions (tranverse)

Input data for additional composite systems may be easily prepared. This is done by selecting the desired fiber and matrix from the available materials listed in appendix C using the variable FBMTDATA.BANK and modifying the appropriate entries in the input data sample illustration.

After the input data have been properly assembled (as shown in fig. 3), they are placed in their physical position (fig. 2) and the code is ready to be run.

### Detailed Description of Input Data

The card group numbers referred to here are given in figure 3 and table I. The sequential order of the entries in each card group is given in table I. Note that most data cards are identified by a mnemonic to indicate the card group in which it belongs in the input data deck. Also, most data cards are divided into fields of eight, with one entry per field being allowed. The mnemonic is entered in

TABLE II.—ICAN SAMPLE INPUT DATASET

FOUR PLY SYMMETRIC LAMINATE. ICAN SAMPLE INPUT DATA.							
STDATA	4	1	2				
T				COMSAT			
F				CSANB			
F				BIDE			
F				RINDV			
T				NONUDF			
PLY	1	1	70.00	70.0	0.0	0.0	0.010
PLY	2	2	70.00	70.0	.0	90.0	.005
PLY	3	2	70.00	70.0	.0	90.0	.005
PLY	4	1	70.00	70.0	.0	.0	.010
MATCRDAS--IMLS	0.55		0.02	AS--IMLS	0.0	0.57	0.03
MATCRDGLAHMHS	.55		.01	AS--IMHS	.4	.57	.01
PLOAD 1000.	0.0		0.0	0.0	NX,NY,NXY,THCS		
PLOAD 0.0	.0		.0		MX,MY,MXY		
PLOAD .0	.0		.0		DMX/QX,DMY/QY,PRSS		

format A8, and the integers are entered in format I8. The real numbers may be entered anywhere in the appropriate field. The following is a brief description of each card group together with examples taken from table II:

**Title card.**

Any title of length up to 80 characters
FOUR PLY SYMMETRIC LAMINATE. ICAN SAMPLE INPUT DATA.

As shown, any title of length up to 80 characters including blanks may be supplied on this card.

**Starting data card.**

1	8,9	16,17	24,25	a <sub>32</sub>
Mnemonic STDATA	N <sub>l</sub> 4	N <sub>lc</sub> 1	N <sub>ms</sub> 2	

This card has a mnemonic STDATA. It contains the overall laminate and loading details. These details are the number of plies  $N_l$ , the number of loading conditions  $N_{lc}$ , and the number of different material systems  $N_{ms}$ .

**Booleans.**

1	6,7
Boolean T or F	This space may be used for comments
T	COMSAT
F	RINDV
F	BIDE
F	CSANB
T	NONUDF

A set of booleans, COMSAT, RINDV, BIDE, CSANB, and NONUDF is defined through these cards. These are five cards, one per each logical variable. The format is L6. The variables have the following functions:

(a) COMSAT.—The letter T in the card will direct the program to perform a complete laminate analysis. A letter F would terminate the program at this stage.

(b) RINDV.—The letter T is entered in the card if the displacements are inputs; otherwise, the letter F is entered.

(c) BIDE.—The letter T is entered in the card if the interply layer contributions on the composite are desired; otherwise, the letter F is entered.

(d) CSANB.—The letter T is entered in the card if the composite has both membrane and bending symmetry; otherwise, the letter F is entered.

(e) NONUDF.—The letter T is entered if the detailed Poisson's ratio difference chart is to be suppressed; otherwise, the letter F is entered.

*Ply details card group.*

1	8.9	16.17	24.25	32.33	40,41	48,49	56,57	64
Mnemonic	Ply	Material MID.	$T_u$	$T_{cu}$	$M$	$\theta_t$	$t_t$	
PLY	1	1	70.00	70.0	.0	0.0	.015	
PLY	2	2	70.00	70.0	.0	90.0	.005	
PLY	3	2	70.00	70.0	.0	90.0	.005	
PLY	4	1	70.00	70.0	.0	0.0	.010	

All the cards in this group have the mnemonic PLY. The number of cards is  $N_p$  with eight entries on each card. The first entry is PLY. The second and third entries are identification numbers for the ply and the material system, respectively. The fourth and fifth entries are the use temperature  $T_u$  and the cure temperature  $T_{cu}$ , respectively. The sixth entry is the percentage of moisture  $M$ . The seventh and the eighth entries are the orientation angle  $\theta$  of the ply and the thickness of the ply, respectively. A default value of 0.005 is taken for the thickness if this entry is missing. The material system identification number should be different not only for different composite systems but also for varying use temperature or moisture content from ply to ply.

*Material system details.*

1	8.9	16.17	24.25	32.33	40,41	48,49	56,57	64
Mnemonic	Fiber, matrix	$k_f$	$k_v$	Fiber, matrix	$V_{sc}$	$k_f$	$k_v$	
MATCRD	AS--IMLS	.55	.02	AS--IMLS	0.0	.57	.03	
MATCRD	SGLAHMHS	.55	.01	AS--IMHS	0.4	.57	.01	

All the cards in this group have the mnemonic MATCRD. The number of cards is  $N_{ms}$  with 10 entries in each card. The first entry is MATCRD. The second and the third entries are coded words for fiber and matrix material of the primary composite. The code words are entered in format 2A4. For example, the code for AS-type fiber is AS-- and epoxy matrix is EPOX. A dictionary of codes for several fibers and matrices is provided in appendix C. The user may choose any combination of fiber and matrix for a composite system. The fourth and the fifth entries pertain to the details of the primary composite system. They are the primary fiber volume ratio and the primary void volume ratio, respectively. The next two entries refer to the secondary composite system which is applicable for the case of the hybrid composite ply. They should be the same as the second and third entries for standard composite systems. The next entry is the secondary composite system volume ratio. This is zero for the standard composite systems. The last two entries are the fiber volume ratio and the void volume ratio for the secondary composite system. These values are entered when applicable.

*Load cards.*

1	8.9	16.17	24.25	32.33	40
Mnemonic	$N_x$	$N_{xy}$	$N_{xy}$	$T_{hcs}$	
PLOAD	1000.	0.0	0.0	0.0	
PLOAD	0.0	0.0	0.0		
PLOAD	0.0	0.0	0.0	0.0	

All the cards in this group start with the mnemonic PLOAD. There are three cards for each loading condition. Thus, the total number of cards is  $3N_{lc}$ . The first card under each loading condition contains entries  $N_x$ ,  $N_y$ , and  $N_{xy}$  for the membrane loads and  $T_{hcs}$  for the orientation of the loads with respect to the structural axes. Similarly the second card contains the bending resultants  $M_x$ ,  $M_y$ , and  $M_{xy}$ . The last card contains the transverse shear resultants  $DM_x$  and  $DM_y$  and the transverse pressures  $P_u$  and  $P_\ell$ .

The user input data are read from I/O unit 5. Apart from this, ICAN uses two more units, 7 and 8, for its I/O operations. Unit 8 is used to store the material properties data base. Unit 7 is used as a scratch file by ICAN. These I/O units must be appropriately defined by using the operating system JCL.

## Output

The following items are printed out by the program:

- (1) ICAN logo
- (2) ICAN coordinate systems
- (3) ICAN input data echo
- (4) Input data summary
- (5) Fiber, matrix, and ply level properties of primary and secondary composites
- (6) Composite three-dimensional strain-stress and stress-strain relations about the structural axes; MAT9 card for MSC/NASTRAN solid elements
- (7) Composite properties generated in array PC
- (8) Composite constitutive equations about the structural axes
- (9) Reduced bending and axial stiffnesses
- (10) Data for finite-element analysis
- (11) Displacement-force relations for the current load condition
- (12) Ply hygrothermomechanical properties/response
- (13) Details of Poisson's ratio mismatch among the plies
- (14) Free edge stresses
- (15) Microstresses and microstress influence coefficients for each different composite material system
- (16) Stress concentration factors around a circular hole
- (17) Locations of probable delamination around circular holes
- (18) Ply stress and strain influence coefficients
- (19) Laminate failure load analysis based on the first-ply failure/maximum stress criteria
- (20) Summary of the laminate failure stress analysis based on two alternatives, first-ply failure and fiber breakage

The printout of the input data summary (app. B item 4) shows details regarding composite geometry, constituent specifications, temperature and moisture conditions, and the loading conditions.

The next few pages of the output are generated by the INHYD program package. They show the fiber-matrix properties for the different composite systems and the ply level properties of the composites (app. B, item 5).

The output of the composite three-dimensional strain-stress temperature and moisture relations and composite stress-strain relations about the structural axes are printed under the following headings:

- (a) 3-D COMPOSITE STRAIN STRESS TEMPERATURE MOISTURE RELATIONS-STRUCTURAL AXES

The matrices  $[E_c]_s^{-1}$ ,  $\{\alpha_c\}_s$ , and  $\{\beta_c\}_s$  in the equation

$$\{\epsilon_c\}_s = [E_c]_s^{-1} \{\sigma_c\}_s - \Delta T_\ell \{\alpha_c\}_s - M_\ell \{\beta_c\}_s$$

where  $\Delta T_\ell = T_\ell - T_{cu}$

are printed by the subroutine GACD3.

(b) 3-D COMPOSITE STRESS STRAIN RELATIONS-STRUCTURAL AXES

The matrix  $[E_c]_s$  in the equation

$$\{\sigma_c\}_s = [E_c]_s \{\epsilon_c\}_s$$

is printed out by the subroutine GACD3.

The subscripts in the preceding equations indicate that the relations are written about the structural axes. It is noted that these properties are only local to subroutine GACD3. They can be made global if needed. The properties needed to prepare the MAT9 card of MSC/NASTRAN are printed out next under the heading MAT9 CARD FOR MSC/NASTRAN SOLID ELEMENTS (app. B, item 6).

The output of the composite properties, generated in array PC, are printed under the following heading (app. B, item 7):

COMPOSITE PROPERTIES—VALID ONLY FOR CONSTANT TEMPERATURE THROUGH THICKNESS LINES 1 to 31: 3-D COMPOSITE PROPERTIES ABOUT MATERIAL AXES LINES 33 to 62: 2-D COMPOSITE PROPERTIES ABOUT STRUCTURAL AXES

Sixty-two entries are printed under this heading as shown in the following list:

Code name	Notation	Explanation
PC(1)	$\rho_c$	weight density
PC(2)	$t_c$	thickness
PC(3) to PC(11)	$[E_c]$	three-dimensional stress-strain relations about material axes
PC(12) to PC(14)	$\{\alpha_c\}$	three-dimensional coefficients of expansion about material axes
PC(15) to PC(18)	$[K_c], H_c$	three-dimensional heat conductivity and heat capacity along material axes
PC(19) to PC(30)	$E_{c11}, G_{c12}, \nu_{c12}$	three-dimensional constants about material axes
PC(31)	$z_c$	distance to reference plane from bottom of composite
PC(32)	-----	blank
PC(33) to PC(38)	$[E_c]^{-1}$	two-dimensional stress-strain relations about structural axes
PC(39) to PC(47)	$E_{c11}, G_{c12}, \nu_{c12}$	two-dimensional elastic constants along structural axes
PC(48) to PC(54)	$\alpha_c, K_c, H_c$	two-dimensional coefficients of thermal expansion, heat conductivity, and heat capacity along structural axes
PC(55) to PC(58)	$D_c$	moisture diffusivities
PC(59) to PC(62)	$\beta_c$	moisture expansion coefficients

Array PC and its corresponding string and headings are controlled by the formats in subroutine GPCFD2. For nonuniform temperature/moisture, the bending equivalent and the membrane equivalent elastic constants may be obtained by utilizing the reduced bending rigidity matrix and the reduced stiffness matrix which are also regular output of ICAN.

The output for the composite constitutive equations are printed in the following manner (app. B, item 8):

$$\begin{array}{lll} \text{FORCES} & \text{FORCE DISPLACEMENT} & \text{DISPL T-FORCES H-FORCES} \\ & \text{RELATIONS} & \\ \left\{ \begin{array}{l} \{N_{cx}\} \\ \{M_{cx}\} \end{array} \right\} & = & \left[ \begin{array}{l} [A_{cx}][C_{cx}] \\ [C_{cx}][D_{cx}] \end{array} \right] \\ & & \left\{ \begin{array}{l} \{E_{csx}\} \\ \{W_{cb}\} \end{array} \right\} - \left\{ \begin{array}{l} \{N_{CT_tX}\} \\ \{M_{CT_tX}\} \end{array} \right\} - \left\{ \begin{array}{l} \{N_{CM_tX}\} \\ \{M_{CM_tX}\} \end{array} \right\} \end{array}$$

The elements of matrices  $A_{cx}$ ,  $C_{cx}$ ,  $D_{cx}$ ,  $N_{CT_tX}$ ,  $N_{CM_tX}$ ,  $M_{CT_tX}$ , and  $M_{CM_tX}$  are printed out by the subroutine GPCFD2.

The output for the reduced bending rigidities is printed under the heading (app. B, item 9): REDUCED BENDING RIGIDITIES. The elements of  $[D_{cx}^R]$  are printed out as a matrix.

Similarly, the output for the reduced axial stiffness  $[A_{cx}^R]$  is printed out under the heading REDUCED STIFFNESS MATRIX. The corresponding formats for the above two outputs are in subroutine GPCFD2 (app. B, item 10).

The next printout comes from the main program under the heading: SOME USEFUL DATA FOR F.E. ANALYSIS. This information is useful for preparing material data cards for finite element codes NASTRAN and MARC.

The inverse of the constitutive equations is printed out in the following manner (app. B, item 11):

$$\begin{array}{c} \text{DISP} \\ \left\{ \begin{array}{l} \{\epsilon_{cax}\} \\ \{w_{cb}\} \end{array} \right\} \end{array} = \begin{array}{c} \text{DISPLACEMENT FORCE} \\ \text{RELATIONS} \\ \left[ \begin{array}{l} [A_{cx}][C_{cx}] \\ [C_{cx}][D_{cx}] \end{array} \right]^{-1} \end{array} \begin{array}{c} \text{FORCES} \\ \left\{ \begin{array}{l} \{N_{cx}\} \\ \{M_{cx}\} \end{array} \right. \begin{array}{l} + \{N_{cT_\ell X}\} \\ + \{M_{cT_\ell X}\} \end{array} \begin{array}{l} + \{N_{cM_\ell X}\} \\ + \{M_{cM_\ell X}\} \end{array} \end{array} \right\}$$

The elements of this inverse are printed out in the subroutine COMSA.

The current values for the loads and corresponding set of ply properties generated in array PL are printed out next (app. B, item 12). The explanations of the 75 entries in the PL property array are given in the following list:

Code name	Notation	Explanation
PL(1,I)	$k_v$	ply void volume ratio
PL(2,I)	$k_{fl}$	ply apparent fiber volume ratio
PL(3,I)	$k_f$	ply actual fiber volume ratio
PL(4,I)	$k_{ml}$	ply apparent matrix volume ratio
PL(5,I)	$k_m$	ply actual matrix volume ratio
PL(6,I)	$\rho_\ell$	ply weight density
PL(7,I)	$t_\ell$	ply layer thickness
PL(8,I)	$\delta_\ell$	ply and interply layer thickness
PL(9,I)	$H_j$	interply layer distortion energy coefficient
PL(10,I)	$z_\ell$	distance from bottom of composite to ply centroid
PL(11,I)	$z_{cg}$	distance from reference plane to ply centroid
PL(12,I)	$\theta_{cs}$	angle from structural axes to composite material axes (same for all plies) (fig. 2)
PL(13,I)	$\theta_\ell$	angle from ply material axes to composite material axes (fig. 2)
PL(14,I)	$\theta_{ls}$	angle from ply material axes to composite structural axes (fig. 2)
PL(15,I) to PL(23,I)	$[E_\ell]^{-1}$	ply stress-strain relations
PL(24,I) to PL(26,I)	$\{\alpha_\ell\}$	ply thermal coefficients of expansion
PL(27,I) to PL(29,I)	$\{K_\ell\}$	ply heat conductivities
PL(30,I)	$H_{cl}$	ply heat capacity
PL(34,I) to PL(42,I)	$E_{\ell 11}, \nu_{\ell 12}, G_{\ell 12}$	ply elastic constants
PL(43,I) to PL(48,I)	$D_\ell$ and $\beta_\ell$	moisture diffusivities and expansion coefficients
PL(49,I)	$\rho_{\mu\text{del}}$	interply delamination factor
PL(50,I)	$T_\ell$	ply temperature
PL(51,I) to PL(60,I)	$S_{\ell 11T}$ , etc.	ply limiting stresses
PL(61,I)	$K_{\ell 12\alpha\beta}$	coefficient in combined stress-strength criterion
PL(62,I)	-----	combined stress-strength criterion
PL(63,I)	-----	interply delamination criterion
PL(64,I) to PL(69,I)	$\{\epsilon_\ell\}, \{\sigma_\ell\}$	ply applied strains and stresses
PL(70,I)	$\Delta\rho_j$	adjacent ply relative rotation
PL(71,I)	-----	Hoffman's failure criterion
PL(72,I)	$M_\ell$	ply moisture
PL(73,I)	$\sigma_{\ell 13}$	transverse shear stress
PL(74,I)	$\sigma_{\ell 23}$	transverse shear stress
PL(75,I)	$\sigma_{\ell 33}$	thickness stretch stress

The next printout shows Poisson's ratio differences between the plies and the composite (app. B, item 13). They are printed out by the subroutine FESTRE under the heading DETAILS OF POISSON'S RATIO MISMATCH.

The stress peaks near the free edge region are printed out next by the subroutine EDGSTR under the heading (app. C, item 14) FREE EDGE STRESSES.

Item 14 of appendix B shows ply stresses in the structural coordinate system and the through-the-thickness stresses  $\sigma_{zz}$ ,  $\sigma_{xz}$ , and  $\sigma_{yz}$ . The boundary layer decay length is also shown in the table under the heading YDCAY LENGTH. Care must be exercised in interpreting the results. They are based on approximate engineering theories and give good qualitative information regarding the relative magnitudes of the peaks in the individual plies. This printout is suppressed in the case of combined loading.

The microstresses in each ply are printed out next by the subroutine MCRSTR (app. B, item 15(a)). Two regions of interest are considered for the computations, the region between the fibers composed entirely of matrix (A) and the region consisting of fibers as well as matrix (B). The stresses are given a descriptive notation. Thus, SM2AL means stress in matrix along the transverse (2) direction in region A due to a ply stress along the longitudinal direction of the material. Figure 4 shows the definitions for regions A and B. The printout also shows microstresses resulting from moisture and temperature differences if nontrivial  $M_\ell$  and  $T_\ell$  are present.

The microstress influence coefficients, stresses due to unit applied stresses in direction 11, 22, 12, 13, and 23 (app. B, item 15(b)); unit temperature difference  $T_\ell$ ; and unit moisture content  $M_\ell$  are output from the subroutine MINCOF. These variables are printed out following the microstresses.

Under the heading STRESS CONCENTRATION FACTORS (app. B, item 16) are printed out the factors  $K_{1xx}$ ,  $K_{1yy}$ , and  $K_{1xy}$  which are due to inplane loading around a circular hole at 5° intervals by the subroutine STRCNF. Cumulative stress concentration due to combined loading may be estimated by simple addition of the respective stress concentration factors.

The next output (app. B, item 17) is under the heading POISSON RATIO DIFFERENCES and results from the subroutine NUDIFS. For each ply, the Poisson's ratio differences,  $(\nu_\ell^i - \nu_c^{i-1})$  and  $(\nu_\ell^i - \nu_c^i)$ , and the products  $K_{1xx} (\nu_\ell^i - \nu_c^i)$ ,  $K_{1yy} (\nu_\ell^i - \nu_c^i)$ , and  $K_{1xy} (\nu_\ell^i - \nu_c^i)$  are printed out at  $\theta$  intervals of 5° around a circular hole. This is suppressed if the boolean NONUDF is set to TRUE. This item shows the locations of probable delamination for each ply. These are the locations where products such as  $K_{1xx} (\nu_\ell^i - \nu_c^i)$ , for example, are maximum.

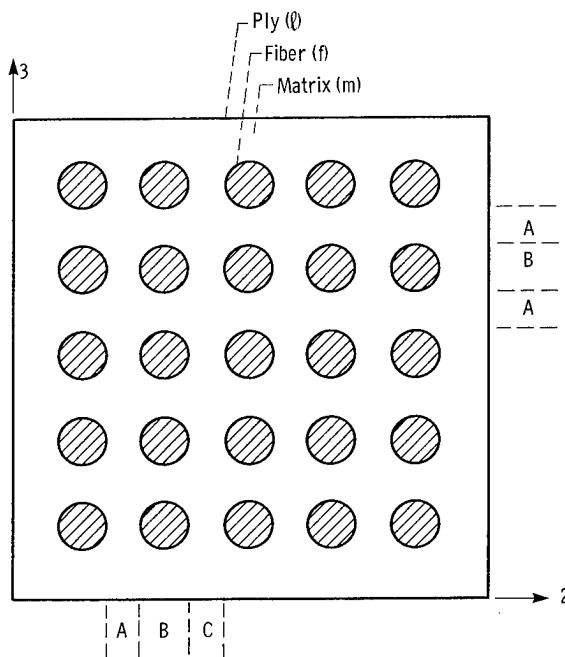

Figure 4.—Definitions of regions for ply microstress calculations.

The next item in appendix B shows the ply stress and strain influence coefficient arrays and ply stress influence coefficient arrays (app. B, item 18). These are computed in the subroutine COMSA and are printed by the main program ICAN. The first table gives the influence coefficients based on unit loads or moments/inch. The second table gives the influence coefficients in terms of unit applied stresses. Explanations of usage of these tables are provided at the end of each table.

The output from the subroutine MSCBFL is printed out next under the heading LAMINATE FAILURE STRESS ANALYSIS (app. B, item 19). The analysis is based on first-ply failure criteria. Results are printed in a tabular form for each ply, and a summary of the analysis is shown in the end (app. B, item 20). The summary shows the critical ply, the failure mode, and the load for each of the applied load types,  $\sigma_{c_{xx}T}$ ,  $\sigma_{c_{xx}C}$ ,  $\sigma_{c_{yy}T}$ ,  $\sigma_{c_{yy}C}$ , and  $\sigma_{c_{xy}S}$ , respectively. The first table shows results based on first-ply failure, and the second table shows results based on fiber failure by breakage.

### **A Typical IBM Terminal Session**

To run ICAN, the user must first install and compile the program on his/her computer according to the system to be used. The procedure used on the Lewis Research Center IBM 370 is described in detail here starting from log on. The computer prompt signals are identified with uppercase letters. User entries are in lowercase letters. The following are prerequisites for the user to be able to run ICAN:

- (1) A knowledge of how to compile and store the object module in the public storage space.
- (2) A knowledge of redit or tedit processors so as to be able to create vs datasets of the input data deck. The details of the input data format have already been described in earlier paragraphs.
- (3) A knowledge of commands like rmgs, mds, ddef, libdef, print, and erase. These are a few of the commands commonly used in running a program on the IBM 370.

The user is advised to migrate the object deck, the input dataset, and the material property data base so as to conserve his/her permanent storage. The object deck, which is a binary version of the compiled source program, is referred to here as OBJ.ICAN. The data base of material properties is referred to as FBMTDATA.BANK.

The session is started by logging on at the terminal. This is achieved by typing logon, userid, and password. The system replies

```
TSS/370 RELEASE 3.0 PRPZ3 FTF18
SOME MESSAGE           TASKID = OBD7 POOLID = LRCFM -
LOGON AT 11:30 ON 01/15/84
```

The user is now ready for the session. The first phase of the session consists of restoring the necessary data sets to temporary storage. This is achieved by the following commands:

```
rmgs obj. ican, aaa
SUCCESSFUL (TEMP) RESTORE OBJ.ICAN AS (AAA)
rmgs fbmtda.bank, ccc
SUCCESSFUL (TEMP) RESTORE FBMTDATA.BANK AS (CCC)
rmgs ican.sample.input, bbb
SUCCESSFUL (TEMP) RESTORE ICAN.SAMPLE.INPUT AS (BBB)
```

At this point, the user has all the necessary data sets to run ICAN in his/her temporary storage.

The input/output fortran units that are utilized by ICAN for its various input/output operations need to be defined next. This forms the second phase of the session and is achieved by

```
ddef ft05f001, vs, bbb
ddef ft06f001, vs, icanout.bbb, ret = t
ddef ft08f001, vs, ccc, ret = t
ddef ft07f001, vs, T7, ret = t
```

During these operations, the system usually responds by the minimum prompt, the underscore (\_).

The third phase consists of loading and executing the object deck and printing out the results. This is done by the following commands:

```

libdef lds, aaa
load gpcm$$$
ican
TERMINATED: STOP
print icanout,bbb, prtsp = edit
PRINT BSN = 8835, 1200 LINES

```

The last phase involves cleaning up the user's storage place and is achieved by issuing the commands

```

release lds
release ft
erase aaa
erase bbb
erase ccc
erase t7

```

The user may either logoff or proceed to execute another run for a different set of input data after the preceding set of commands.

## Programmers Manual

A brief description of the main program (or control program) and theoretical equations programmed in the code are presented in this portion of the report. The subroutine descriptions follow the order of execution as shown in the flowchart (fig. 2(b)) rather than the physical sequential order (fig. 2(a)). It is assumed in the following discussion that the user has a working knowledge of computer programming and that he/she is familiar with the terminology appropriate to multilayered composite mechanics.

The assumptions and details leading to the derivation of the equations programmed in the code are not included here. However, they are described in the references cited. It is suggested that the interested user have these references available to him/her.

The information provided in this portion of the code together with the source program listing enables the user to modify, implement, and extend the code according to need.

### Main Program

The main program contains the global variables, the various subroutines, the input data and format, the various program control statements, and the output. These are discussed subsequently. The flowchart of the program is shown in figure 5.

The global variables are given in the following list:

boolean	CSANB, BIDE, RINDV, COMSAT, NONUDF
integers	$N_b, N_{pb}, N_{pc}, N_f, N_{lc}, M, Q_b, Q_s, Q_p, Q_r, Q_f$
real	$\theta_{cs}, \rho_f, \rho_m, d_f, E, \nu, G, f, m, \pi$
real arrays	$K_{vb}, K_{fb}, \theta_{lc}, t_\ell(1,1000), P_\ell(75,1000), P_c(1,62)$
maximum dimensions	$E_{cb}, E_{cf}, E_{cm}, A_{cx}, C_{cx}, D_{cx}, D_{cx}^R, A_{cx}^R(3,3), \alpha_f, \alpha_m, \alpha_e, N_{cT_\ell X}, M_{dT_\ell X}, N_{cM_\ell X}, M_{cM_\ell X}, \epsilon_{csz}, \epsilon_{cbx}(1,3), L_{sc}(1,6), M_{cx}, N_{cx}(3, N_{lc}), D_v(10,6), AINF(6,1000,8), (\lambda_y)_{P,S}, (\lambda_x)_{P,S}, (\ell_x)_{P,S}, (\ell_y)_{P,S}, (1,1000)$

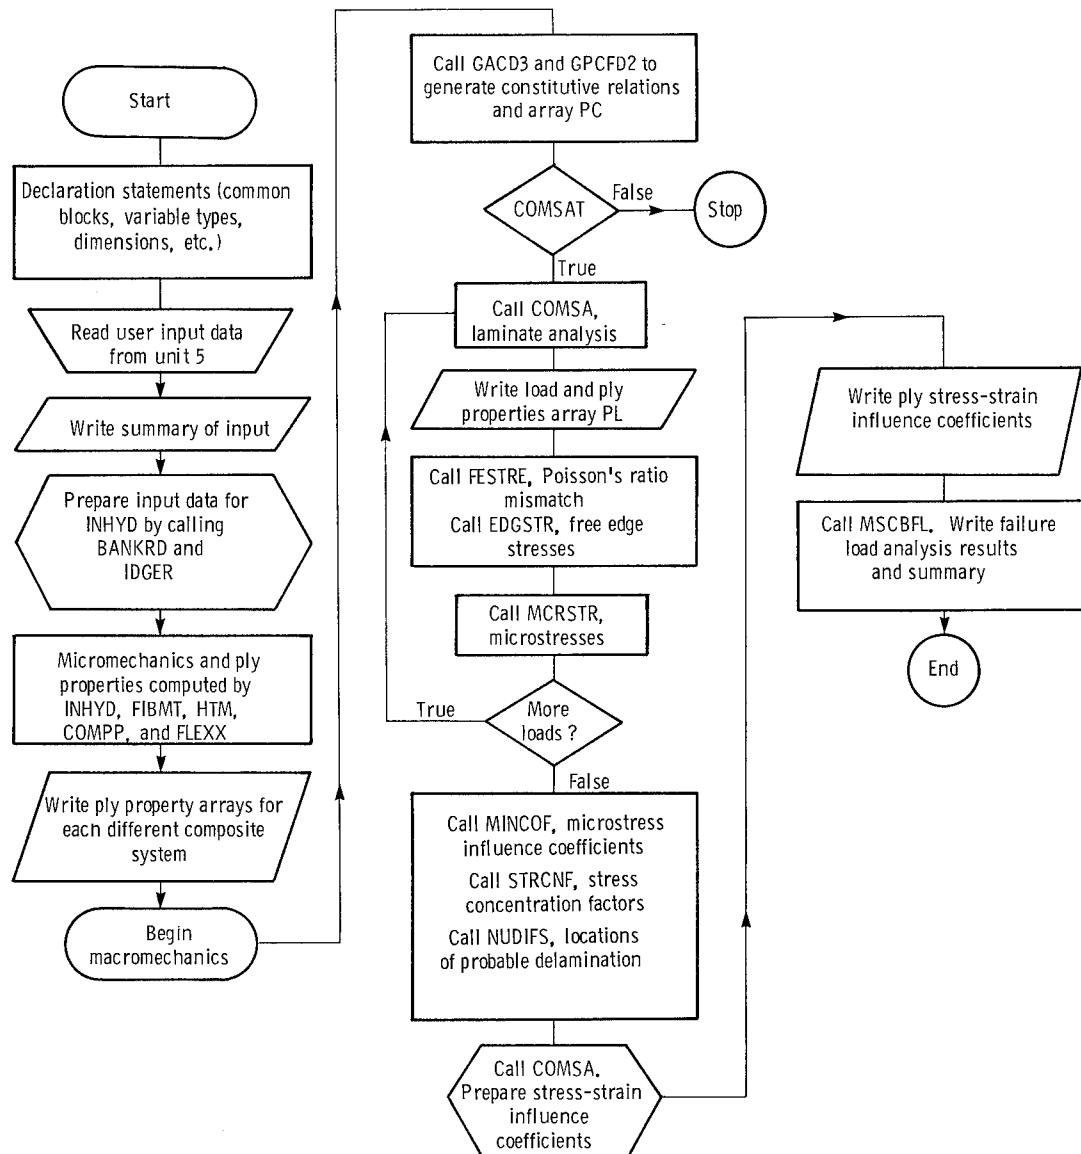

Figure 5.—ICAN program flowchart.

string arrays

title (80 characters) read in.

$P_\ell$  (eight spaces per field,  $N_{p\ell}$  fields)

$C_{e1}$  (six spaces per field, six fields)

$C_{e2}$  (six spaces per field, six fields)

$P_{cp}$  (six spaces per field,  $N_{pc}$  fields)

codes C

current dimensions

$N_b, N_{pb}, N_{pc}, N_f, N_{ms}$

real arrays

$K_{vb}, K_{fb}, \theta_{lc}, t_\ell(1, N_\ell), P_\ell(75, N_\ell)$

current dimensions

$P_c(1, N_{pc})$ ,

AINF (6,  $N_b$ , 8),  $\lambda_{y,x,P,S}(1, N_\ell)$ ,

$\ell_{x,y,P,S}(1, N_\ell)$

The subroutines are as follows:

INVA

inverse of an array

GACD3

generates composite three-dimensional elastic and thermal properties and the two-dimensional thermal properties

BLOCK DATA	DISP (String) and RESF (String)
GPCFD2	generates composite two-dimensional elastic constants and constitutive equations
COMSA	generates the ply strain and stress states due to applied loads, checks for ply failure and interply delamination, and generates the ply stress and strain influence coefficients
INHYB	generates ply level properties with the aid of subroutines FIBMT, HTM, COMPP, and FLEXX
BANKRD/IDGER	generates constituent properties by using the data base FBMTDATA.BANK and arranges them in a proper format so as to input to INHYD
FESTRE	computes Poisson's ratio mismatch between the plies and the composite
EDGSTR	computes interlaminar free edge stresses
MCRSTR/MINCOF	generates the microstresses and the corresponding influence coefficients
STRCNF	generates the stress concentration factors around a circular hole
NUDIFS	generates the Poisson's ratio differences within the plies and the probable locations of delamination around the free edge of a circular hole
MSCBFL	performs failure load analysis based on first ply failure/maximum-stress criteria and prints the summary
AMINF	minimum value of an array
AMAXF	maximum value of an array
FLRLD	determines the failure load, failure mode, and the ply location
These subroutines are described in detail in the next section.	
INPUT	title, $N_p$ , $N_{\ell_p}$ , $N_{ms}$ , CSANB, BIDE, RINDV, COMSAT, NONUDF, $t_p$ , $\theta_p$ , $T_p$ , fiber name, matrix name, $k_{vp}$ , $k_{fp}$ , $k_{sc}$ , $N_{cx}$ , $M_{cx}$ , $DM_{cx}$ , $P_u$ , $P_{\ell}$

(For substitution and definition, see appendix A.)

### Subroutine Description

**Subroutine INVA (N,A,C).**—This subroutine computes the inverse of a square matrix A by Gauss elimination and stores it in array C. The check

$$|A| \neq 0$$

is made and, if satisfied, the program continues; otherwise, the message SINGULAR MATRIX is displayed. The subroutine inputs are N, the matrix order, and the matrix A. The output is

$$A^{-1} \rightarrow C$$

**Subroutine GACD3(C).**—This subroutine generates the three-dimensional hygrothermoelastic properties of the composite about its structural ( $x, y, z$ ) and material (1,2,3) axes. The angle  $\theta$  is measured from  $x$  of the structural axes system. (See fig. 6.) In figure 6, replace  $xy$  etc. by 11 etc. and

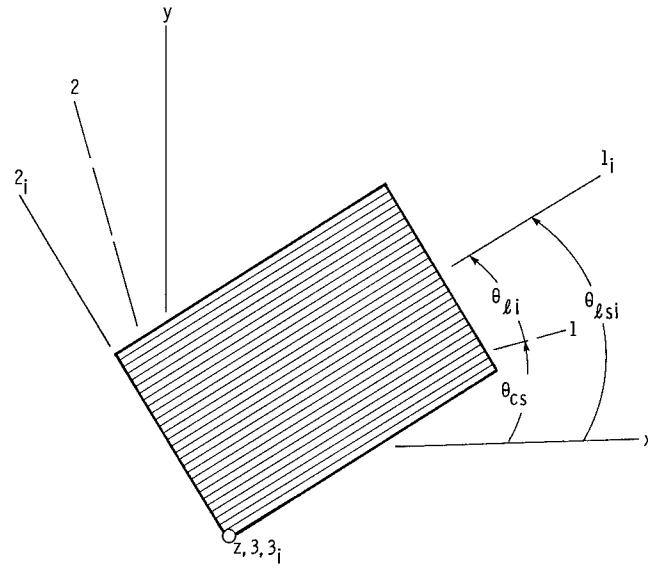

Figure 6.—Ply orientation geometry. Composite structural axes,  $x, y, z$ ; composite material axes,  $1, 2, 3$ ; ply material axes (coincides with fiber direction),  $1_i, 2_i, 3_i$ .

measure  $\theta$  from the material axes to obtain properties about the material axes. These composite properties are generated from the following equations:

$$[E_c] = \frac{1}{t_c} \left[ \sum_{i=1}^{N_t} (z_{\ell i+1} - z_{\ell i}) [R_{\ell i}]^T [E_{\ell i}] [R_{\ell i}] + \sum_{j=1}^{N_{t-1}} H_j [S_j] \right]$$

$$\{\alpha_c\} = \frac{1}{t_c} [E_c] \sum_{i=1}^{N_t} (z_{\ell i+1} - z_{\ell i}) [R_{\ell i}]^T [E_{\ell i}] \{\alpha_{\ell i}\}$$

$$\{\beta_c\} = \frac{1}{t_c} [E_c] \sum_{i=1}^{N_t} (z_{\ell i+1} - z_{\ell i}) [R_{\ell i}]^T [E_{\ell i}] \{\beta_{\ell i}\}$$

The arrays  $\{\alpha_c\}$ ,  $\{\beta_c\}$ ,  $\{\alpha_{\ell i}\}$ , and  $\{\beta_{\ell i}\}$  in the preceding equations are given by

$$\{\alpha_c\} = [\alpha_{cxx} \alpha_{cyy} \alpha_{czz} \alpha_{cyz} \alpha_{czx} \alpha_{cxy}]^T$$

$$\{\beta_c\} = [\beta_{cxx} \beta_{cyy} \beta_{czz} \beta_{cyz} \beta_{czx} \beta_{cxy}]^T$$

and

$$\{\alpha_{\ell i}\} = [\alpha_{\ell 11} \alpha_{\ell 22} \alpha_{\ell 33} 0 0 0]^T$$

$$\{\beta_{\ell i}\} = [\beta_{\ell 11} \beta_{\ell 22} \beta_{\ell 33} 0 0 0]^T$$

For all practical purposes, the two-dimensional thermal coefficients of expansion about the composite structural axes are the same as  $\alpha_{cyy}$ ,  $\alpha_{cyy}$ , and  $\alpha_{cyy}$  in the array  $\{\alpha_c\}$  for the three-dimensional case.

The matrix  $[E_c]^{-1}$  is given by

$$[E_c]^{-1} = \begin{bmatrix} \frac{1}{E_{c11}} & -\frac{\nu_{c21}}{E_{c22}} & \frac{\nu_{c31}}{E_{c33}} & 0 & 0 & 0 \\ -\frac{\nu_{c12}}{E_{c11}} & \frac{1}{E_{c22}} & -\frac{\nu_{c32}}{E_{c33}} & 0 & 0 & 0 \\ -\frac{\nu_{c13}}{E_{c11}} & -\frac{\nu_{c23}}{E_{c22}} & -\frac{1}{E_{c33}} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{E_{c23}} & 0 & 0 \\ 0 & 0 & 0 & 0 & \frac{1}{E_{c31}} & 0 \\ 0 & 0 & 0 & 0 & 0 & \frac{1}{E_{c12}} \end{bmatrix}$$

Note that for the case of an anisotropic material, the elements (1,6), (2,6), (3,6), and (4,5) and their symmetric parts will not be zero.

The matrices  $[E_{\ell i}]^{-1}$  and  $[R_{\ell i}]^{-1}$  are given by

$$[E_{\ell i}]^{-1} = \begin{bmatrix} \frac{1}{E_{\ell 11}} & -\frac{\nu_{\ell 21}}{E_{\ell 22}} & -\frac{\nu_{\ell 31}}{E_{\ell 33}} & 0 & 0 & 0 \\ -\frac{\nu_{\ell 12}}{E_{\ell 11}} & \frac{1}{E_{\ell 22}} & -\frac{\nu_{\ell 32}}{E_{\ell 33}} & 0 & 0 & 0 \\ -\frac{\nu_{\ell 13}}{E_{\ell 11}} & -\frac{\nu_{\ell 23}}{E_{\ell 22}} & \frac{1}{E_{\ell 33}} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{E_{\ell 23}} & 0 & 0 \\ 0 & 0 & 0 & 0 & \frac{1}{E_{\ell 31}} & 0 \\ 0 & 0 & 0 & 0 & 0 & \frac{1}{E_{\ell 12}} \end{bmatrix}_i$$

$$[R_{\tilde{\theta}}] = \begin{bmatrix} \cos^2 \theta & \sin^2 \theta & 0 & 0 & 0 & \frac{1}{2} \sin 2\theta \\ \sin^2 \theta & \cos^2 \theta & 0 & 0 & 0 & -\frac{1}{2} \sin 2\theta \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & \cos \theta & \sin \theta & 0 \\ 0 & 0 & 0 & -\sin \theta & \cos \theta & 0 \\ -\sin 2\theta & \sin 2\theta & 0 & 0 & 0 & \cos 2\theta \end{bmatrix}_i$$

where  $\theta = \theta_{\tilde{\theta}}$  for properties about the composite material and  $\theta = \theta_{\tilde{\theta}} + \theta_{cs}$  for properties about the composite structural axes. (See fig. 6.)

The matrix  $[S_{\tilde{\theta}}]$  is given by

$$[S_{\tilde{\theta}}] = \frac{1}{4} \begin{bmatrix} A^2 & -A^2 & 0 & 0 & 0 & -AB \\ -A^2 & A^2 & 0 & 0 & 0 & AB \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ -AB & AB & 0 & 0 & 0 & B^2 \end{bmatrix}_j$$

Here  $A = \sin 2\theta_i - \sin 2\theta_{i-1}$  and  $B = \cos 2\theta_i - \cos 2\theta_{i-1}$  where  $i > 1$  and denotes the ply index.

The angles  $\theta_i$  and  $\theta_{i-1}$  (fig. 6) are given by

$$\theta_i = \theta_{\tilde{\theta}} + \theta_{cs}$$

$$\theta_{i-1} = \theta_{\tilde{\theta}-1} + \theta_{cs}$$

The composite heat capacity is the same for both the two- and the three-dimensional cases. It is given by

$$h_c = \frac{1}{t_c} \sum_{i=1}^{N_t} h_{\tilde{\theta}} t_{\tilde{\theta}}$$

and  $t_c$  is given by

$$t_c = \sum_{i=1}^{N_t} t_{\tilde{\theta}}$$

The composite three-dimensional heat conductivities along the composite material axes, assuming an orthotropic composite, are given by

$$K_{c11} = \frac{1}{t_c} \sum_{i=1}^{N_\ell} t_{\ell i} (K_{\ell 11} \cos^2 \theta_\ell + K_{\ell 22} \sin^2 \theta_\ell)_i$$

$$K_{c22} = \frac{1}{t_c} \sum_{i=1}^{N_\ell} t_{\ell i} (K_{\ell 11} \sin^2 \theta_\ell + K_{\ell 22} \cos^2 \theta_\ell)_i$$

$$\frac{1}{K_{c33}} = \frac{1}{t_c} \sum_{i=1}^{N_\ell} \left( \frac{t_\ell}{K_{\ell 33}} \right)_i$$

The angle  $\theta_\ell$  is measured from the material axes (fig. 6)

The composite two-dimensional heat conductivities along the composite structural axes are given by (see ref. 9 for the transformation equations)

$$K_{cyy} = \frac{1}{t_c} \sum_{i=1}^{N_\ell} t_{\ell i} (K_{\ell 11} \cos^2 \theta + K_{\ell 22} \sin^2 \theta)_i$$

$$K_{cyy} = \frac{1}{t_c} \sum_{i=1}^{N_\ell} t_{\ell i} (K_{\ell 11} \sin^2 \theta + K_{\ell 22} \cos^2 \theta)_i$$

$$K_{cxy} = K_{cxy} = \frac{1}{t_c} \sum_{i=1}^{N_\ell} t_{\ell i} (K_{\ell 22} - K_{\ell 11})_i \sin 2\theta_i$$

$$K_{czz} = K_{c33}$$

The angle  $\theta$  in the last set of equations is measured from the composite structural axes and is equal to  $\theta_{cs} + \theta_\ell$ . The inputs to the subroutine are  $N_\ell$ ,  $z_{\ell i+1}$ ,  $z_{\ell i}$ ,  $\theta_{cs}$ ,  $\theta_{\ell i}$ ,  $[E_i]$ ,  $H_j$ ,  $\{\alpha_{\ell i}\}$ ,  $h_{\ell i}$ , and  $\{K_{\ell i}\}$ , which are all global. The variable  $N_\ell$  is input data. The remaining quantities are either generated or are transferred from information stored in PL(11,I), PL(13,I), PL(15,I-23,I), PL(8,I), PL(24,I) to PL(26,I), PL(30,I), PL(27,I), and PL(29,I). The outputs are  $t_c$  and the arrays are  $[E_c]^{-1}$ ,  $\{\alpha_c\}$ ,  $[E_c]$ ,  $h_c$ , and  $\{K_c\}$ . The composite thickness  $t_c$  is stored in PC(2). The arrays  $[E_c]^{-1}$ ,  $\{\alpha_c\}$ , and  $[E_c]$  for both composite material and structural axes are printed out under the headings 3-D COMPOSITE STRAIN STRESS TEMPERATURE MOISTURE RELATIONS-STRUCTURAL AXES and 3-D COMPOSITE STRESS STRAIN RELATIONS-STRUCTURAL AXES.

The composite material axes properties  $[E_c]$  and  $\{\alpha_c\}$  are stored in PC(3) to PC(14) as global variables. The corresponding moduli are stored in PC(19) to PC(30). The three-dimensional heat conductivities and heat capacity along the material axes are stored in PC(15) to PC(18). The two-dimensional thermal coefficients of expansion along the structural axes are stored in PC(48) to PC(50). The two-dimensional heat conductivities and heat capacity along the structural axes are stored in PC(51) to PC(54). Note that the heat capacity is a scalar quantity and is independent of the reference axes. Therefore, PC(54) equals PC(18). The moisture diffusivities and expansion coefficients are stored in entries PC(55) to PC(62).

**Subroutine BLOCK DATA.**—In this block, the strings  $C_{e1}$  and  $C_{e2}$ , which are printed out with the composite constitutive equations, are defined. The string  $C_{e1}$  contains the resultant force notation  $N_{cx}$ ,  $N_{cy}$ ,  $N_{cxy}$ ,  $M_{cx}$ ,  $M_{cy}$ , and  $M_{cxy}$ . The string  $C_{e2}$  contains the notation for the corresponding displacements.

**Subroutine GPCFD2 (RESF, DISP, PROPC).**—This subroutine generates the required section properties and the force-deformation temperature-moisture relations for a two-dimensional

multilayered composite. It also generates the plane-stress elastic constants for the composite. The force-deformation temperature-moisture relations generated in this procedure are defined in the following equation:

$$\begin{Bmatrix} \{N_{cx}\} \\ \{M_{cx}\} \end{Bmatrix} = \begin{bmatrix} [A_{cx}] & [C_{cx}] \\ [C_{cx}] & [D_{cx}] \end{bmatrix} \begin{Bmatrix} \epsilon_{csx} \\ w_{cbx} \end{Bmatrix} - \begin{Bmatrix} \{N_{cT_{tx}}\} \\ \{M_{cT_{tx}}\} \end{Bmatrix} - \begin{Bmatrix} \{N_{cM_{tx}}\} \\ \{M_{cM_{tx}}\} \end{Bmatrix}$$

The generic equations for the elements in the arrays  $[A_{cx}]$ ,  $[C_{cx}]$ ,  $[D_{cx}]$ ,  $\{N_{cT_{tx}}\}$ ,  $\{M_{cT_{tx}}\}$ ,  $\{N_{cM_{tx}}\}$ , and  $\{M_{cM_{tx}}\}$  are

$$\begin{aligned} [A_{cx}] &= \sum_{i=1}^{N_t} (z_{\bar{q}+1} - z_{\bar{q}}) [R_{\bar{q}}]^T [E_{\bar{q}}]^{-1} [R_{\bar{q}}] + \sum_{j=1}^{N_t-1} H_j [S_j] \\ [C_{cx}] &= \frac{1}{2} \sum_{i=1}^{N_t} (z_{\bar{q}+1}^2 - z_{\bar{q}}^2) [R_{\bar{q}}]^T [E_{\bar{q}}]^{-1} [R_{\bar{q}}] + \sum_{j=1}^{N_t-1} z_{rpj} H_j [S_j] \\ [D_{cx}] &= \frac{1}{3} \sum_{i=1}^{N_t} (z_{\bar{q}+1}^3 - z_{\bar{q}}^3) [R_{\bar{q}}]^T [E_{\bar{q}}]^{-1} [R_{\bar{q}}] + \frac{1}{2} \sum_{j=1}^{N_t-1} z_{rpj}^2 H_j [S_j] \\ \{N_{cT_{tx}}\} &= \sum_{i=1}^{N_t} \Delta T_{\bar{q}} (z_{\bar{q}+1} - z_{\bar{q}}) [R_{\bar{q}}] [E_{\bar{q}}]^{-1} \{\alpha_{\bar{q}}\} \\ \{N_{cM_{tx}}\} &= \sum_{i=1}^{N_t} M_{\bar{q}} (z_{\bar{q}+1} - z_{\bar{q}}) [R_{\bar{q}}] [E_{\bar{q}}]^{-1} \{\beta_{\bar{q}}\} \\ \{M_{cT_{tx}}\} &= \frac{1}{2} \sum_{i=1}^{N_t} \Delta T_{\bar{q}} (z_{\bar{q}+1}^2 - z_{\bar{q}}^2) [R_{\bar{q}}]^T [E_{\bar{q}}]^{-1} \{\alpha_{\bar{q}}\} \\ \{M_{cM_{tx}}\} &= \frac{1}{2} \sum_{i=1}^{N_t} M_{\bar{q}} (z_{\bar{q}+1}^2 - z_{\bar{q}}^2) [R_{\bar{q}}]^T [E_{\bar{q}}]^{-1} \{\beta_{\bar{q}}\} \end{aligned}$$

where  $\Delta T_{\bar{q}} = T_{\bar{q}} - T_{cui}$

The arrays  $\{\alpha_{\bar{q}}\}$ ,  $\{\beta_{\bar{q}}\}$ ,  $[R_{\bar{q}}]$ ,  $[E_{\bar{q}}]$ , and  $[S_j]$  are

$$\{\alpha_{\bar{q}}\} = [\alpha_{11} \quad \alpha_{22} \quad 0]^T$$

$$\{\beta_{\bar{q}}\} = [\beta_{11} \quad \beta_{22} \quad 0]^T$$

$$[R_{\bar{q}}] = \begin{bmatrix} \cos^2 \theta & \sin^2 \theta & \frac{1}{2} \sin 2\theta \\ \sin^2 \theta & \cos^2 \theta & -\frac{1}{2} \sin 2\theta \\ -\sin 2\theta & \sin 2\theta & \cos 2\theta \end{bmatrix}_i$$

$$[E_{\ell}] = \begin{bmatrix} \frac{1}{E_{\ell 11}} & -\frac{\nu_{\ell 21}}{E_{\ell 22}} & 0 \\ -\frac{\nu_{\ell 12}}{E_{\ell 11}} & \frac{1}{E_{\ell 22}} & 0 \\ 0 & 0 & \frac{1}{G_{\ell 12}} \end{bmatrix}_i$$

$$S_{j22} = S_{j11} = \frac{1}{4}(\sin 2\theta_i - \sin 2\theta_{i-1})^2$$

$$S_{j21} = S_{j12} = -S_{j11}$$

$$S_{j32} = S_{j23} = \frac{1}{4}(\sin 2\theta_i - \sin 2\theta_{i-1})(\cos 2\theta_i - \cos 2\theta_{i-1})$$

$$S_{j31} = S_{j13} = -S_{j23}$$

$$S_{j33} = \frac{1}{4}(\cos 2\theta_i - \cos 2\theta_{i-1})^2$$

Here  $\theta_i$  equals the  $\theta_{cs} + \theta_\ell$  (fig. 6). The reduced bending rigidities (ref. 6) are generated in this procedure according to the equation

$$D_{cx}^R = [D_{cx} - C_{cx} A_{cx}^{-1} C_{cx}]$$

The reduced axial stiffnesses are generated in the procedure according to the equation

$$A_{cx}^R = [A_{cx} - C_{cx} D_{cx}^{-1} C_{cx}]$$

The two-dimensional composite elastic constants are generated from the following equation (assuming  $T_{\ell i} = T_\ell$  for  $i = 1$  to  $N_\ell$  and  $M_{\ell i} = M_\ell$  for  $i = 1$  to  $N_\ell$ ):

$$[E_{cx}]^{-1} = \frac{1}{t_c} \left\langle \sum_{i=1}^{N_\ell} (z_{\ell i+1} - z_{\ell i}) [R_{\ell i}]^T [E_{\ell i}]^{-1} [R_{\ell i}] + \sum_{j=1}^{N_\ell} H_j [S_j] \right\rangle$$

where

$$t_c = \sum_{i=1}^{N_\ell} t_{\ell i}$$

The inputs to this subroutine are  $t_{\ell i}$ ,  $T_{\ell i}$ ,  $M_{\ell i}$ ,  $\theta_i$  (relative to composite structural axes),  $H_j$ , and the ply elastic constants. These quantities are global and are located, respectively, in PL(7,I), PL(50,I), PL(72,I), PL(14,I), PL(9,I), and PL(31,I) to PL(42,I). The arrays  $[R_{\ell i}]^T$ ,  $[E_{\ell i}]^{-1}$ ,  $[R_{\ell i}]$ , and  $[S_j]$  and the dimensions  $z_{\ell i}$  are generated within this subroutine.

The outputs are the force-deformation-temperature-moisture relations, which are stored in the global arrays  $ACX = A_{cx}$ ,  $RAC = A_{cx}^R$ ,  $CPC = C_{cx}$ ,  $FLX = D_{cx}$ ,  $RDC = D_{cx}^R$ ,  $NSDT = N_{cT_\ell x}$ ,  $MSDT = M_{cT_\ell x}$ ,  $NSDH = N_{cM_\ell x}$ , and  $MSDH = M_{cM_\ell x}$ . These are printed out under the heading

FORCES FORCE DISPLACEMENT RELATIONS DISPL T-FORCES H-FORCES. The reduced bending rigidities are printed out under the heading REDUCED BENDING RIGIDITIES. The reduced axial stiffnesses are printed out under the heading REDUCED STIFFNESS MATRIX. The inverse of the constitutive equations

$$\begin{bmatrix} [A_{cx}] & [C_{cx}] \\ [C_{cx}] & [D_{cx}] \end{bmatrix}^{-1}$$

are printed out under the heading DISP DISPLACEMENT FORCE RELATIONS FORCES. The distances  $z_c$ ,  $z_{\ell i}$ , and  $z_{\ell i}$  are stored in PC(31,I), PL(10,I), and PL(11,I), respectively. The two-dimensional composite stress-strain relations are stored in PC(33) to PC(38), and the two-dimensional composite moduli and Poisson's ratios are stored in PC(39) to PC(47). The two-dimensional thermal properties are stored in PC(48) to PC(54), as is described in the section subroutine GACD3.

**Subroutine COMSA (M).**—In this subroutine the stress and strain states of each ply are computed given the edge membrane forces, the ply temperature, and the changes in curvature. In addition, two-ply, combined stress-strength criteria and the interply delamination criterion are generated. Also generated are the ply stress-strain influence coefficients. The equations programmed for the  $i$ th strain and stress states are

$$\begin{aligned} \{\epsilon_{\ell i}\} &= [R_{\ell i}][A_{cx}]^{-1} \langle [N_{cx}] + [N_{cT_{\ell i}x}] + [N_{cM_{\ell i}x}] + [C_{cx}]\{w_{cbx}\} \rangle - z[R_{\ell i}]\{w_{cbx}\} \\ \{\sigma_{\ell i}\} &= [E_{\ell i}]^{-1} [R_{\ell i}][A_{cx}]^{-1} \langle [N_{cx}] + [N_{cT_{\ell i}x}] + [N_{cM_{\ell i}x}] + [C_{cx}]\{w_{cbx}\} \rangle \\ &\quad - [E_{\ell i}]^{-1} \langle T_{\ell i}\{\alpha_{\ell i}\} + M_{\ell i}\{\beta_{\ell i}\} + z[R_{\ell i}]\{w_{cbx}\} \rangle \end{aligned}$$

The reference plane strains  $\epsilon_{csx}$  and the curvature changes are computed from

$$\begin{Bmatrix} \{\epsilon_{csx}\} \\ \{w_{cbx}\} \end{Bmatrix} = \begin{bmatrix} [A_{cx}] & [C_{cx}]^{-1} \\ [C_{cx}] & [D_{cx}] \end{bmatrix} \begin{Bmatrix} \{N_{cx}\} \\ \{M_{cx}\} \end{Bmatrix} + \begin{Bmatrix} \{N_{cT_{\ell i}x}\} \\ \{M_{cT_{\ell i}x}\} \end{Bmatrix} + \begin{Bmatrix} \{N_{cM_{\ell i}x}\} \\ \{M_{cM_{\ell i}x}\} \end{Bmatrix}$$

when either the membrane force or the moments or both are given.

The strains are generated locally in EPSL and SIGL, respectively, and are stored in PL(64,I) to PL(69,I). The matrices  $[R_{\ell i}]$  and  $[E_{\ell i}]$  are generated locally from information transferred from PL(14,I) and PL(31,I) to PL(42,I). The distance  $z_{\ell i}$ , the ply temperature  $T_{\ell i}$ , and the ply moisture  $M_{\ell i}$  are transferred from PL(11,I), PL(50,I), and PL(72,I), respectively. The remaining matrices are

$$\begin{aligned} A_{cx} &\rightarrow \text{ACX} \\ C_{cx} &\rightarrow \text{CPC} \\ N_{cT_{\ell i}x} &\rightarrow \text{NSDT} \\ N_{cM_{\ell i}x} &\rightarrow \text{NSDH} \\ N_{cx} &\rightarrow \text{NSB}_m \\ M_{cT_{\ell i}x} &\rightarrow \text{MSDT} \\ M_{cM_{\ell i}x} &\rightarrow \text{MSDH} \\ M_{cx} &\rightarrow \text{MSB}_m \end{aligned}$$

and  $w_{cbx} \rightarrow \text{WXX}_m$  (local curvature from bending analysis), where  $m$  denotes the load condition.

It is important to note that the stress analysis in the coded form also handles the case where both the reference plane membrane strains and the local curvatures are given. In this case the ply strains are given by

$$\{\epsilon_{cx_i}\} = \{\epsilon_{csx}\} - z\{w_{cbx}\}$$

where  $\{\epsilon_{cx_i}\}$  is the  $i$ th ply strain along the structural axis,  $\{\epsilon_{csx}\}$  is the reference plane membrane strain,  $z$  is the distance from the reference plane to the centroid of the  $i$ th ply, and  $\{w_{cbx}\}$  is the local curvature. These variables are read in the array  $D_{vm}$ , where  $m$  denotes the load condition.

The corresponding  $i$ th ply stresses are given by

$$\{\sigma_i\} = [E_{\bar{g}}]^{-1} \left\langle [R_{\bar{g}}] \{\epsilon_{cx_i}\} - \Delta T_{\bar{g}} \{\alpha_{\bar{g}}\} - M_{\bar{g}} \{\beta_{\bar{g}}\} \right\rangle$$

$$\Delta T_{\bar{g}} = T_{\bar{g}} - T_{cui}$$

where  $\{\sigma_{\bar{g}}\}$  is the  $i$ th ply stress along the material axes,  $[E_{\bar{g}}]$  is the  $i$ th ply elastic constant about the material axes,  $[R_{\bar{g}}]$  is the transformation matrix of the  $i$ th ply,  $\{\epsilon_{cx_i}\}$  is the  $i$ th ply strain along the structural axes as given by a previous equation,  $T_{\bar{g}}$  is the temperature of the  $i$ th ply,  $T_{cui}$  is the cure temperature of the  $i$ th ply,  $\{\alpha_{\bar{g}}\}$  is the thermal coefficient of expansion of the  $i$ th ply along the material axes,  $M_{\bar{g}}$  is the moisture content of the  $i$ th ply, and  $\{\beta_{\bar{g}}\}$  is the moisture expansion coefficient of the  $i$ th ply along the material axes.

The displacement force relations are printed out in the following format:

DISPLACEMENT	DISPLACEMENT FORCE RELATIONS	FORCES
$\begin{cases} \{U_{cx}\} \\ \{W_{cx}\} \end{cases}$	$\begin{bmatrix} [A_{cx}] & [C_{cx}] \\ [C_{cx}] & [D_{cx}] \end{bmatrix}^{-1}$	$\begin{cases} \{N_{cx}\} \\ \{M_{cx}\} \end{cases}$

Two similar sets are printed out. In the first set, the displacement and force vectors are in symbolic form. In the second set, the displacement and force vectors have their numerical values. (See outputs of trial cases, app. B.)

The failure criterion may be determined by either of the following methods:

(1) Modified distortion energy

$$F = 1 - \left[ \left( \frac{\sigma_{\ell 11\alpha}}{S_{\ell 11\alpha}} \right)^2 + \left( \frac{\sigma_{\ell 22\beta}}{S_{\ell 11\beta}} \right)^2 - K_{\ell 12\beta} \frac{\sigma_{\ell 11\alpha}}{S_{\ell 11\alpha}} \frac{\sigma_{\ell 22}}{S_{\ell 22}} + \left( \frac{\sigma_{\ell 12S}}{S_{\ell 12S}} \right)^2 \right]_i \rightarrow \text{PL}(62,1)$$

The parameters  $\alpha$  and  $\beta$  are specified as follows:

$$\alpha = \begin{cases} T & \sigma_{\ell 11} \geq 0 \\ C & \sigma_{\ell 11} < 0 \end{cases}$$

$$\beta = \begin{cases} T & \sigma_{\ell 22} \geq 0 \\ C & \sigma_{\ell 22} < 0 \end{cases}$$

$$S_{\ell 11\alpha} = \begin{cases} S_{\ell 11T} & \alpha = T \\ \min(S_{\ell 11C}, S_{\ell 11CD}) & \alpha = C \end{cases}$$

$$S_{\ell 22\alpha} = \begin{cases} S_{\ell 22T} & \beta = T \\ S_{\ell 22C} & \beta = C \end{cases}$$

$$K'_{\ell 12\alpha\beta} = K'_{\ell 12\alpha\beta} \frac{(1 + 4\nu_{\ell 12} - \nu_{\ell 13})E_{\ell 22} + (1 - \nu_{\ell 23})E_{\ell 11}}{[E_{\ell 11}E_{\ell 22}(2 + \nu_{\ell 12} + \nu_{\ell 13})(2 + \nu_{\ell 21} + \nu_{\ell 23})]^{1/2}}$$

$$K'_{\ell 12\alpha\beta} = \begin{cases} \text{BET}(1, 7) & \alpha, \beta = T \\ \text{BET}(2, 7) & \alpha = C, \beta = T \\ \text{BET}(1, 8) & \alpha = T, \beta = C \\ \text{BET}(2, 8) & \alpha, \beta = C \end{cases}$$

The multiplier of  $K'_{\ell 12\alpha\beta}$  was generated in the main program and is stored in PL(61,I). The constant  $K'_{12\alpha\beta}$  constitute theory-experiment correlation factors. These are set as unity in COMSA. However, the user can modify the correlation factors if he/she wishes, by redefining the matrix BET in the subroutine COMSA.

(2) Hoffmann's criterion (ref. 9)

$$S_{\ell 11C} = \min(S_{\ell 11C}, S_{\ell 11CD})$$

$$F = 1 - \left[ \frac{\sigma_{\ell 11}^2 - \sigma_{\ell 11}\sigma_{P22}}{S_{\ell 11C}S_{\ell 11T}} + \frac{\sigma_{\ell 22}^2}{S_{\ell 22C}S_{\ell 22T}} + \frac{S_{\ell 11C} - S_{\ell 11T}}{S_{\ell 11C}S_{\ell 11T}}\sigma_{\ell 11} + \frac{S_{\ell 22C} - S_{\ell 22T}}{S_{\ell 22C}S_{\ell 22T}}\sigma_{\ell 22} + \frac{\sigma_{\ell 12}^2}{S_{\ell 12S}^2} \right]_i \rightarrow \text{PL}(71, I)$$

$F > 0$  no failure

$F = 0$  incipient failure

$F < 0$  failure

The interply delamination criterion for the  $j$ th interply layer at the  $m$ th load condition is governed by

$$\left[ 1 - \left( \frac{|\Delta\varphi|}{\Delta\varphi_{\text{del}}} \right) \right]_j \rightarrow \text{PL}(63, I) \quad \text{when } i > 1$$

$$\Delta\varphi_j = \frac{1}{2}(\epsilon_{cyy} - \epsilon_{cxx})(\sin 2\theta_i - \sin 2\theta_{i-1}) + \frac{1}{2}\epsilon_{cxy}(\cos 2\theta_i - \cos 2\theta_{i-1}) \{ \epsilon_{cx} \} = \{ A_{cx} \}^{-1} \langle \{ N_{cx} \} + \{ N_{cTx} \} + \{ N_{cMx} \} + [C_{cx}] \{ w_{cbx} \} \rangle$$

or by the displacement force equation described previously.

The inputs to the subroutine are the ply angle measured from the structural axes ( $\theta_i$ , from PL(14,I)); the distance from the reference plane to the centroid of the ply ( $z_g$ , from PL(11,I)); the ply temperature ( $T_g$ , from PL(50,I)); the interply delamination limit ( $\Delta\varphi_{\text{del},j}$ , from PL(60,I)); the ply thermoelastic properties stored in PL(24 to 26,I) and PL(31 to 42,I); the ply extensional and coupling rigidities,  $A_{cx} = \text{ACX}$  and  $C_{cx} = \text{CPC}$ ; the local curvatures  $w_{cbx} = \text{WXX}$ ; the adjustment constants  $K'_{\ell 12TT} = \text{BET}(1, 7)$ ,  $K'_{\ell 12CT} = \text{BET}(2, 7)$ ,  $K'_{\ell 12TC} = \text{BET}(1, 8)$ , and  $K'_{\ell 12CC} = \text{BET}(2, 8)$ ; and the load conditions  $N_{cx} = \text{NBS}(m)$ .

The subroutine outputs are the modified distortion energy PL(62,I), Hoffmann's criterion PL(71,I), the interply delamination criterion PL(63,I), and the adjacent ply relative rotation ( $\Delta\varphi_j$ , from PL(70,I)).

**Subroutine EDGSTR.**—This subroutine computes the interlaminar stresses  $\sigma_{zz}$ ,  $\sigma_{zy}$ , and  $\sigma_{zx}$  near a straight free edge region of a finite width, infinitely long plate under uniform extension. The equations used are based on an approximate formulation analogous to that in reference 18. The calculations are performed in two parts. The first part consists of computations of decay lengths for

the interlaminar stresses. The decay length is a measure of a free edge region in which the interlaminar stresses may be significant. This is achieved in the main program. The second part uses this information to compute the interlaminar stresses in the subroutine EDGSTR. The pertinent equations are discussed in the following paragraphs. Note that in the case of hybrid composite plies, the calculations are repeated not only for the primary composite but also for the secondary composite by using the appropriate ply constituent properties. The primary and the secondary composites are distinguished by using the letters P and S, respectively, in the Fortran variables. In the case of biaxial loading, this subroutine is bypassed as there are no free edges.

**Part 1.—Decay length or boundary layer width computations.** The interlaminar stresses near the free edge are assumed to decay exponentially. The decay length is calculated with the aid of the following equations:

$$\{\ell_b\} = \frac{-\alpha_{\ell\ell}}{\lambda} \left( \frac{t_{\ell}}{t_c} \right)$$

where

$$\alpha = \ell_n^{-1} (0.001)$$

and

$$\{\lambda\} = \left\{ \frac{G_m}{E_{\ell\ell}} \left[ \sqrt{\frac{\pi}{4(1-k_{\nu})k_f}} - 1 \right] \right\}^{1/2}$$

The calculations are repeated for each layer. Quantities  $\ell_b$  and  $\lambda_i$  are stored in arrays YPL and PLMDAY. These quantities pertain to the free edge parallel to the load axis  $X$ . The corresponding quantities for the load axis parallel to  $Y$  are stored in arrays XPL and PLMDAX. These are computed by replacing  $E_{\ell\ell}$  with  $E_{\ell\ell}$  in the preceding equations. For the intraply hybrid composite, the respective arrays for the secondary composite are denoted by YSL, SLMDAY, XSL, and SLMDAX. Note that the letter P is replaced by S. This notation is followed consistently throughout the text. The labeled common block ILAB6 is used to store and pass these data to subroutine EDGSTR.

**Part 2.—Interlaminar stress computations.** In the EDGSTR subroutine, the ply stresses PL(67,I) to PL(69,I) are transformed to the structural coordinate system  $x$ ,  $y$ , and  $z$ . These stresses are stored in the matrix SIGMA (3,I) for each layer. The interlaminar stresses  $\{\sigma_{\ell\ell z}\}$  are computed with the aid of the following relations:

$$\sigma_{\ell\ell z}^i = \alpha^2 \left( \frac{t_{\ell}^i}{\ell_b} \right)^2 \left[ \frac{\sigma_{\ell\ell y}^i}{2} + \frac{1}{t_{\ell}^i} \sum_{j=N_{\ell}}^{j+1} \sigma_{\ell\ell y}^j t_{\ell}^j \right]$$

for  $i = N_{\ell-1}$  to  $N_{\ell}/2 + 1$

$$\sigma_{\ell\ell z}^{N_{\ell}} = \alpha^2 \left( \frac{t_{\ell}^{N_{\ell}}}{L_b^{N_{\ell}}} \right)^2 \frac{\sigma_{\ell\ell y}^{N_{\ell}}}{2}$$

The interlaminar shear stresses  $\{\sigma_{\ell\ell y}\}$  and  $\{\sigma_{\ell\ell x}\}$  are calculated by

$$\sigma_{\ell\ell y}^i = \frac{\alpha}{(e\alpha - 1)} \frac{\sum_{j=N_{\ell}}^{j+1} \sigma_{\ell\ell y}^j t_{\ell}^j}{\ell_b^i} \quad \text{for } i = N_{\ell} \text{ to } \frac{N_{\ell}}{2} + 1$$

and

$$\sigma_{\ell z x}^i = \frac{3 \sum_{j=N_\ell}^{j+1} \sigma_{\ell n y}^j}{\ell_b^i} \quad \text{for } i = N_\ell \text{ to } \frac{N_\ell}{2} + 1$$

In these equations, the computations are started from the top layer ( $i = N_\ell$ ). After the midplane is approached ( $i = N_\ell/2 + 1$ ), the calculations are repeated starting from the bottom layer ( $i = 1$ ) and continued until  $i$  becomes ( $N_\ell/2 - 1$ ).

The interlaminar stresses are stored in the arrays YSZZP, SZYP, and SZXP for the primary composite and in the arrays YSZZS, SZYS, and SZXS for the secondary composite. They are, however, made dimensionless by dividing by the applied normal stress  $\sigma_{\ell z x}$ .

**Subroutine STRCNF.**—This subroutine calculates the stress concentration factors around a circular hole due to membrane loading. The equations used are taken from reference 19 and are strictly applicable for infinite plates. Three factors are computed in the subroutine and are defined by the following equations:

$$K_{1xx} = \frac{\sigma_{\theta\theta}}{\sigma_{xx\infty}}$$

$$K_{1yy} = \frac{\sigma_{\theta\theta}}{\sigma_{yy\infty}}$$

$$K_{1xy} = \frac{\sigma_{\theta\theta}}{\sigma_{xy\infty}}$$

Quantities  $\sigma_{xx\infty}$ ,  $\sigma_{yy\infty}$ , and  $\sigma_{xy\infty}$  are the applied stresses, and  $\sigma_{\theta\theta}$  is the hoop stress at any angle  $\theta$  from the load axis. The stress concentration factors are stored in the local arrays XK1, XK3, and TEMP. The expressions for  $K_{1xx}$ ,  $K_{1yy}$ , and  $K_{1xy}$  are the following:

$$\begin{aligned} K_{1xx} &= \frac{E_{ctt}}{E_{cxx}} \left\{ -\sqrt{\frac{E_{cxy}}{E_{cyy}}} \cos^2 \theta + \left[ 1 + \sqrt{2 \left( \frac{E_{cyy}}{E_{cyy}} - \nu_{cxy} \right) + \frac{E_{cyy}}{G_{cxy}}} \right] \sin^2 \theta \right\} \\ K_{1yy} &= \frac{E_{crr}}{E_{cxx}} \left\{ -\sqrt{\frac{E_{cyy}}{E_{cyy}}} \cos^2 \theta + \left[ 1 + \sqrt{2 \left( \frac{E_{cyy}}{E_{cyy}} - \nu_{cxy} \right) + \frac{E_{cyy}}{G_{cxy}}} \right] \sin^2 \theta \right\} \\ K_{1xy} &= \frac{E_{ctt}}{E_{cyy}} \left\{ 1 + \sqrt{\frac{E_{cyy}}{E_{cyy}}} + \left[ \sqrt{2 \left( \frac{E_{cyy}}{E_{cyy}} - \nu_{cxy} \right) + \frac{E_{cyy}}{G_{cxy}}} \right. \right. \\ &\quad \left. \left. - \left[ \sqrt{2 \left( \frac{E_{cyy}}{E_{cyy}} - \nu_{cxy} \right) + \frac{E_{cyy}}{G_{cxy}}} \sin 2\theta \right] \right] \right\} \end{aligned}$$

In the preceding expressions,  $E_{ctt}$  and  $E_{crr}$  are the composite moduli in the tangential and radial directions at angle  $\theta$ . Angle  $\theta$  is measured from the x-axis for  $K_{1xx}$  and  $K_{1xy}$  and from the y-axis for  $K_{1yy}$ . The program rearranges the computed  $K_{1yy}$  values so that they correspond to the same location as those of  $K_{1xx}$  and  $K_{1xy}$ .

**Subroutine NUDIFS.**—In this subroutine, the Poisson's ratio differences between the adjacent plies and the composite are computed around a circular hole at  $5^\circ$  intervals. The products of the differences and the corresponding stress concentration factors are computed next. These products are expected to provide insight into the probable delamination locations. It is assumed that onset of

delamination is likely to occur at the locations for which the product of Poisson's ratio mismatch with the corresponding stress concentration factor is a maximum. Accordingly, these products are computed at 5° intervals and the maxima are calculated. Two sets of tables are the output from this subroutine. The first table comes out optionally if the boolean NONUDF is set to FALSE. It contains all the details of the computations. The second table consists of the summary of results, with notes on the maxima and the locations. The following are the programmed equations:

At any angle  $\theta$  the Poisson's ratio is computed by

$$\nu_{crt} = E_{crr} \left[ \frac{\nu_{cxy}}{E_{cxx}} - \left( \frac{1+2\nu_{cxy}}{E_{cxx}} + \frac{1}{E_{cyy}} - \frac{1}{G_{cxy}} \right) \cos^2 \theta \sin^2 \theta \right]$$

The ply Poisson's ratio is given by

$$\{\nu_{\ell rt}\} = E_{\ell rr} \left[ \frac{\nu_{\ell 12}}{E_{\ell 11}} - \left( \frac{1+2\nu_{\ell 12}}{E_{\ell 11}} + \frac{1}{E_{\ell 22}} - \frac{1}{G_{\ell 12}} \right) \cos^2 \theta \sin^2 \theta \right]$$

The difference in Poisson's ratio between the  $i$ th and  $(i+1)$ th plies is given by  $(\nu_{\ell rt}^{i+1} - \nu_{\ell rt}^i)$ , and the difference with respect to the composite is given by  $(\nu_{\ell rt}^i - \nu_{crt})$ . These are stored in the arrays A2 and A3, respectively. The products of  $K_{1xx}$ ,  $K_{1yy}$ , and  $K_{1xy}$  with A3 are computed next and are stored in the arrays A5, A6, and A7, respectively. The maxima and their location in each of the four quadrants (0-90, 90-180, 180-270, and 270-0) are computed by calling the subroutine AMAXF for the three arrays A5, A6, and A7. The values of stress concentration factors are passed through the labeled common block ILAB8 from the subroutine STRCNF.

**Subroutine MSCBFL (AINF).**—A complete laminate failure stress analysis, based on first-ply failure and the maximum strength criteria, is performed in this subroutine. The inputs to this routine are the ply allowables  $S_{\ell 11C}$ ,  $S_{\ell 11T}$ ,  $S_{\ell 22C}$ ,  $S_{\ell 22T}$ , and  $S_{\ell 12S}$  and the ply influence coefficient matrix AINF. The ply stress allowables are generated by the INHYD routines and are stored in the ply properties array PL. These are accessed through the labeled common block ILAB2. The ply stress influence coefficients are generated by COMSA and the main program and are passed to the present routine by the subroutine argument.

The failure stress for a particular ply due to a specific loading is given by the ratio of the allowable strength to the ply stress influence coefficient. For example, the failure stress due to a tensile load is given by

$$S_c^i = \frac{S_{\ell 11T}^i}{\text{Fact1}^i}$$

where  $\text{Fact1}^i$  is the stress influence coefficient for  $i$ th ply due to unit tensile loading,  $S_{\ell 11T}^i$  is the strength allowable for  $i$ th ply in longitudinal tension, and  $S_c^i$  is the failure stress for the  $i$ th ply due to a tensile loading. The failure stresses are stored in the matrix FAILD. In the case of temperature/moisture presence, the allowable strengths are updated to take into account temperature or moisture stresses; the failure stresses are computed with and without the effects of temperature- and moisture-induced stresses for comparison. The program considers primarily five different loadings, longitudinal compression and tension, transverse compression, and tension and inplane shear.

After the failure load computations for each ply are determined, the active failure mode and the corresponding failure strength for each type of loading are determined by calling the subroutine AMINF. This subroutine returns the value of the minimum failure load, the ply number, and the failure mode as output. The output from this subroutine is printed under the heading LAMINATE FAILURE STRESS ANALYSIS.

**Subroutine MCRSTR.**—This subroutine generates the microstresses in the ply constituents due to the inplane loading. These are stored in the ply microporoperty arrays PLMP and PLMS for the

primary and the secondary composites. The ply constituent properties and the applied loads are inputs to this subroutine. They are accessed with the aid of the common blocks PBANK, MFBANK, ILAB2, ILAB5, and ILAB9. The PLMP and PLMS each contain 41 entries which are explained in the following list:

<i>Code name</i>	<i>Algebraic notation</i>	<i>Fortran variable</i>
<b>PLM(1,I)</b>	$\sigma_{m11L}$	SM1L
PLM(2,I)	$\sigma_{m11T}$	SM1T
PLM(3,I)	$\sigma_{f11L}$	SF1L
PLM(4,I)	$\sigma_{f11T}$	SF1T
PLM(5,I)	$\sigma_{m22L}^{(A)}$	SM2AL
PLM(6,I)	$\sigma_{m22T}^{(A)}$	SM2AT
PLM(7,I)	$\sigma_{m22L}^{(B)}$	SM2BL

PLM(40,I)	$\sigma_{m33}^{(B)}$	SM3BDM
PLM(41,I)	$\sigma_{f33}^{(B)}$	SM3BDM

In this list, entries 26 to 41 are suppressed automatically if the temperature gradients and moisture contents are not present. The superscripts A and B refer to two regions as described in figure 4.

The microstresses are calculated with the aid of the following equations: (For notation and sign conventions, see figs. 4 and 6.)

Ply microstresses due to a longitudinal stress  $\sigma_{\ell 11}$  are given by

$$\sigma_{m11} = (E_m/E_{\ell 11})\sigma_{\ell 11}$$

$$\sigma_{f11} = (E_{f11}/E_{\ell 11})\sigma_{\ell 11}$$

$$\sigma_{m22}^{(A)} = (\nu_m - \nu_{\ell 12})(E_m/E_{\ell 11})\sigma_{\ell 11}$$

$$\sigma_{m22}^{(B)} = \sigma_{f22}^{(B)} = -\frac{1 - \sqrt{k_f}}{\sqrt{k_f}} \sigma_{\ell 11}$$

$$\sigma_{m33}^{(A)} = \sigma_{m22}^{(A)}$$

$$\sigma_{m33}^{(B)} = \sigma_{m22}^{(B)}$$

$$\sigma_{f33}^{(B)} = \sigma_{f22}^{(B)}$$

Ply microstresses due to a transverse stress  $\sigma_{\ell22}$  are given by

$$\sigma_{m11} = \left( \nu_m - \frac{\nu_{f12} E_m}{E_{\ell11}} \right) \sigma_{\ell22}$$

$$\sigma_{f11} = \left( \nu_{f12} - \nu_{\ell12} \frac{E_{f11}}{E_{\ell11}} \right) \sigma_{\ell22}$$

$$\sigma_{m22}^{(A)} = (E_m/E_2) \sigma_{\ell22}$$

$$\sigma_{m22}^{(B)} = (E_{\ell22}/E_2) \sigma_{\ell22}$$

$$\sigma_{f22}^{(B)} = (E_{\ell22}/E_2) \sigma_{\ell22}$$

where  $E_2$  is given by

$$E_2 = (1 - \sqrt{k_f}) E_m + \frac{\sqrt{k_f} E_m}{1 - \sqrt{k_f} \left( 1 - \frac{E_m}{E_{f22}} \right)}$$

$$\sigma_{m33}^{(A)} = (\nu_m/\nu_{\ell23}) (E_m/E_{\ell22}) \sigma_{\ell22}$$

$$\sigma_{m33}^{(B)} = \frac{1 - \sqrt{k_f}}{\sqrt{k_f}} \sigma_{\ell22}$$

$$\sigma_{f33}^{(B)} = \sigma_{m33}^{(B)}$$

Ply microstresses due to inplane shear stress ( $\sigma_{\ell12}$ ) are given by

$$\sigma_{m12}^{(A)} = (G_m/G_{12}) \sigma_{\ell12}$$

$$\sigma_{m12}^{(B)} = (G_{\ell12}/G_{12}) \sigma_{\ell12}$$

$$\sigma_{f12}^{(B)} = (G_{\ell12}/G_{12}) \sigma_{\ell12}$$

where  $G_{12}$  is given by

$$G_{12} = \left(1 - \sqrt{k_f}\right) G_m + \frac{\sqrt{k_f} G_m}{1 - \sqrt{k_f} \left(1 - \frac{G_m}{G_{23}}\right)}$$

$$\sigma_{m13}^{(A)} = \sigma_{m12}^{(A)}$$

$$\sigma_{m13}^{(B)} = \sigma_{m12}^{(B)}$$

$$\sigma_{f13}^{(B)} = \sigma_{f12}^{(B)}$$

Ply microstresses due to through-the-thickness shear stress  $\sigma_{\ell23}$  are given by

$$\sigma_{m23}^{(A)} = (G_m/G_{\ell23})\sigma_{\ell23}$$

$$\sigma_{m23}^{(B)} = (G_{23}/G_{\ell23})\sigma_{\ell23}$$

where  $G_{23}$  is given by

$$G_{23} = \frac{G_m}{1 - \sqrt{k_f} \left(1 - \frac{G_m}{G_{f23}}\right)}$$

$$\sigma_{f23}^{(B)} = \sigma_{m23}^{(B)}$$

Ply microstresses due to temperature gradient  $\Delta T_\ell$  are given by

$$\sigma_{m11} = (\alpha_{\ell11} - \alpha_m)\Delta T_\ell E_m$$

$$\sigma_{f11} = (\alpha_{\ell11} - \alpha_{f11})\Delta T_\ell E_{f11}$$

$$\sigma_{m22}^{(A)} = (\alpha_{\ell22} - \alpha_m)\Delta T_\ell E_m$$

$$\sigma_{m22}^{(B)} = \sigma_{f22}^{(B)} = -\frac{1 - \sqrt{k_f}}{\sqrt{k_f}} \sigma_{m22}^{(A)}$$

$$\sigma_{m33}^{(A)} = \sigma_{m22}^{(A)}$$

$$\sigma_{m33}^{(B)} = \sigma_{m22}^{(B)}$$

$$\sigma_{f33}^{(B)} = \sigma_{f22}^{(B)}$$

$$\Delta T_\ell = T_\ell - T_{cu}$$

Ply microstresses due to moisture  $M_\ell$  are given by

$$\sigma_{m11} = (\beta_{\ell11} - \beta_m) M_\ell E_m$$

$$\sigma_{f11} = \beta_{\ell11} M_\ell E_{f11}$$

$$\sigma_{m22}^{(A)} = (\beta_{\ell22} - \beta_m) M_\ell E_m$$

$$\sigma_{m22}^{(B)} = -\frac{1 - \sqrt{k_f}}{\sqrt{k_f}} \sigma_{m22}^{(A)}$$

$$\sigma_{m33}^{(A)} = \sigma_{m22}^{(A)}$$

$$\sigma_{m33}^{(B)} = \sigma_{m22}^{(B)}$$

$$\sigma_{f33}^{(A)} = \sigma_{f33}^{(B)}$$

**Subroutine MINCOF.**—This subroutine generates the microstress influence coefficients for each different material system used in the layup. The equations used are similar to those programmed for MCRSTR. However, the influence coefficients are based on the application of unit load in a specific direction or unit temperature difference or unit moisture content. The influence coefficients are stored in the matrix PINF. This matrix has 17 entries. They are described in the following list:

Entry	Algebraic notation	Fortran variable
PINF(1,K,NLD)	$\sigma_{m11}$	SM11
PINF(2,K,NLD)	$\sigma_{m22}^{(A)}$	SM22A
PINF(3,K,NLD)	$\sigma_{m22}^{(B)}$	SM22B
PINF(4,K,NLD)	$\sigma_{m12}^{(A)}$	SM12A
PINF(5,K,NLD)	$\sigma_{m12}^{(B)}$	SM12B
PINF(6,K,NLD)	$\sigma_{m13}^{(A)}$	SM13A
PINF(7,K,NLD)	$\sigma_{m13}^{(B)}$	SM13B
PINF(8,K,NLD)	$\sigma_{m23}^{(A)}$	SM23A
PINF(9,K,NLD)	$\sigma_{m23}^{(B)}$	SM23B

PINF(10,K,NLD)	$\sigma_{m33}^{(A)}$	SM33A
PINF(11,K,NLD)	$\sigma_{m33}^{(B)}$	SM33B
PINF(12,K,NLD)	$\sigma_{f11}$	SF11
PINF(13,K,NLD)	$\sigma_{f22}^{(B)}$	SF22B
PINF(14,K,NLD)	$\sigma_{f33}^{(B)}$	SF33B
PINF(15,K,NLD)	$\sigma_{f12}$	SF12
PINF(16,K,NLD)	$\sigma_{f13}$	SF13
PINF(17,K,NLD)	$\sigma_{f23}^{(B)}$	SF23B

The dimension K varies from 1 to NMS, where NMS is the number of material systems. NLD varies from 1 to 7. The expression NLD = 1 to 5 refers to unit applied stresses in 11, 22, 12, 13, and 23, respectively. The expression NLD = 6 corresponds to unit temperature loading, and the expression NLD = 7 corresponds to unit moisture loading.

The microstress influence coefficients are computed for secondary composites and optionally computed for intraply hybrid composites. These are stored in the matrix SINF.

**Subroutines *AMAXF*, *AMINF*, *LOGO*, and *LOGO2*.**—These subroutines perform several auxiliary duties. *AMAXF* finds the maximum value of a one-dimensional array and its location. *AMINF* finds the minimum value of a one-dimensional array and its location. These two subroutines are utilized by *MSCBFL* and *NUDIFS* in conjunction with searching for failure loads and the probable locations of delamination. *LOGO* is a subroutine to generate the ICAN emblem for the output. The description of the material and the structural coordinate system by appropriate figures is generated by the subroutine *LOGO2*.

**Subroutine *INHYD*.**—This subroutine generates the composite ply properties, necessary for the laminate response analysis. The inputs to this routine are the constituent properties which are supplied in the appropriate format by the subroutines *IDGED* and *BANKRD*. *INHYD* calls the subroutines *FIBMT*, *COMPP*, and *HTM* to perform the micromechanics analysis, including the analysis of hygrothermal effects. The ply properties are stored in the array *PROPS*, which is accessed by the main program through the labeled common block *PBANK*. *INHYD* is called once for each different material system by the main program. The outputs of *INHYD* show the properties of the fiber, matrix, and composite.

The fiber and matrix properties for the primary composite are read in from the input provided by *IDGER*. These are stored in arrays *PF* and *PM*. Similarly, the arrays *SF* and *SM* are used to store the properties of secondary composite constituents if the composite is of the hybrid type. The program then checks for temperature and moisture. The properties of the matrix are updated for the presence of temperature and moisture. The following are the equations programmed to account for the hygrothermal property degradation:

The wet glass transition temperature is computed from

$$T_{gwr} = (0.005M_\ell^2 - 1M_\ell + 1)T_{gdr}$$

where  $T_{gwr}$  is the wet glass transition temperature,  $T_{gdr}$  is the dry glass transition temperature for the resin matrix, and  $M_\ell$  is the percentage of moisture by weight.

The reduction factors  $X_{mp}$  and  $X_{tp}$  are computed from

$$X_{mp} = \sqrt{(T_{gwr} - T_u)/(T_{gdr} - T_o)}$$

$$X_{tp} = 1/X_{mp}$$

where  $T_o$  is the reference temperature (70 °F), and  $T_u$  is the use temperature.

The moduli and strengths of the matrix are multiplied by  $X_{mp}$  to obtain the new properties for the matrix. The density is given by

$$\rho_{mw} = \rho_m + 3\rho_m k_m M_\ell / 100$$

The thermal properties, such as heat capacity, thermal expansion coefficient, and thermal conductivity are multiplied by the second factor  $X_{tp}$  to account for the hygrothermal conditioning.

After the property arrays PF, PM, SF, and SM are properly filled, the program chooses either FIBMT or HTM subroutines to perform micromechanics. The subroutine HTM is chosen if temperature/moisture effects are to be taken into consideration. Otherwise, FIBMT is chosen for dry room temperature property computations. The outputs from these routines are primary and secondary composite ply properties. They are stored in the arrays P and S, respectively. These properties are made common to subroutine COMPP through the common blocks ILAB1 and ILAB3. The subroutine COMPP is called by INHYD for hybrid composites to compute the hybrid composite ply properties. These properties are stored in the array H. One of the arrays P, S, or H are passed to ICAN via common block PBANK and the array PROPS. For example, if the ply is made of 100 percent primary composite only, the array PROPS is assigned to have the same entries as P, etc.

The subroutine INHYD also calls FLEXX, which performs a flexural strength analysis. However, these are only for additional information and are not used by ICAN at the present time.

**Subroutine FIBMT (C, F, M, VF, VM, VP, KV, IFLAG).**—This subroutine generates properties of a ply by using the constituent properties which are supplied from the subroutine INHYD. The constituent properties are stored in the arrays F and M; F contains the fiber properties, and M contains the matrix properties. The composite properties are stored in the array C, which is returned to INHYD. The theory behind the programmed equations is discussed in reference 13. The following is a description of each entry in the arrays C, F, and M, with the corresponding algebraic notation:

#### Composite Properties Array C(I)

Entry	Description	Notation
C(1)	elastic moduli	$E_{\ell 11}$
C(2)	elastic moduli	$E_{\ell 22}$
C(3)	elastic moduli	$E_{\ell 33}$

#### Matrix Properties Array

Entry	Description	Notation
M(1)	elastic modulus	$E_m$
M(2)	shear modulus	$G_m$
M(3)	Poisson's ratio	$\nu_m$
M(4)	thermal expansion coefficient	$\alpha_m$
M(5)	density	$\rho_m$
M(6)	heat capacity	$C_m$
M(7)	heat conductivity	$K_m$
M(8)	strength	$S_{mT}$
M(9)	strength	$S_{mC}$
M(10)	strength	$S_{mS}$
M(11)	moisture coefficient	$\beta_m$
M(12)	diffusivity	$D_m$

The following are the programmed equations for the entries in array C:

**Normal moduli:**

$$E_{\ell 1} = k_f E_{f11} + k_m E_m$$

$$E_{\ell 22} = \frac{E_m}{1 - \sqrt{k_f} (1 - E_m/E_{f22})}$$

$$E_{\ell 33} = E_{\ell 22}$$

**Shear moduli:**

$$G_{\ell 12} = \frac{G_m}{1 - \sqrt{k_f} \left( 1 - \frac{G_m}{G_{f12}} \right)}$$

$$G_{\ell 13} = G_{\ell 12}$$

$$G_{\ell 23} = \frac{G_m}{1 - k_f \left( 1 - \frac{G_m}{G_{f23}} \right)}$$

**Poisson's Ratio:**

$$\nu_{\ell 12} = \nu_m + k_f (\nu_{f12} - \nu_m)$$

$$\nu_{\ell 13} = \nu_{\ell 12}$$

$$\nu_{\ell 23} = k_f \nu_{f23} + k_m \left( 2\nu_m - \frac{\nu_{\ell 12}}{E_{\ell 11}} E_{\ell 22} \right)$$

**Coefficients of thermal expansion:**

$$\alpha_{\ell 11} = \frac{\alpha_{f11} + k_m [(\alpha_m E_m / E_{f11}) - \alpha_{f11}]}{1 + k_m \left( \frac{E_m}{E_{f11}} - 1 \right)}$$

$$\alpha_{\ell 22} = \alpha_m(1 - \sqrt{k_f}) \left[ \frac{1 + k_f \nu_m E_{f11}}{E_{f11} + k_m(E_m - E_{f11})} \right] + \alpha_{f22} k_f$$

$$\alpha_{33} = \alpha_{\ell 22}$$

**Density:**

$$\rho_\ell = \rho_f k_f + \rho_m k_m$$

**Heat capacity:**

$$C_\ell = \frac{(k_f C_f \rho_f + k_m C_m \rho_m)}{\rho_\ell}$$

**Heat conductivities:**

$$K_{\ell 1} = k_f K_{f11} + k_m K_m$$

$$K_{\ell 22} = (1 - \sqrt{k_f}) K_m + \frac{\sqrt{k_f}}{1 - \sqrt{k_f} \left( 1 - \frac{K_m}{K_{f22}} \right)} K_m$$

$$K_{\ell 33} = K_{\ell 22}$$

In the preceding equations,  $K_m$  should be replaced by

$$K_m \rightarrow (1 - \sqrt{k_\nu}) K_m + \frac{K_m \sqrt{k_\nu}}{1 - \sqrt{k_\nu} \left( 1 - \frac{K_m}{K_\nu} \right)}$$

if there are voids. The quantity  $K_\nu$  is the void conductivity.

**Strengths:**

$$S_{\ell 1T} = S_{fT} (k_f + k_m E_m / E_{f11})$$

The longitudinal compressive strength is computed based on three different criteria, rule of mixtures, fiber microbuckling, and delamination. The minimum of the three estimates is returned as  $S_{\ell 1C}$ . The equations for the three cases are

$$S_{\text{fl1C}} \text{ (rule of mixtures)} = S_{fc}(k_f + k_m E_m / E_{f11})$$

$$S_{11C} \text{ (delamination)} = (13S_{\text{fl2}} + S_{mc})$$

$$S_{\text{fl1C}} \text{ (fiber microbuckling)} = \frac{F_2 G_m}{1 - k_f \left(1 - \frac{G_m}{G_{\text{fl2}}}\right)}$$

The transverse strengths are calculated from

$$S_{\text{fl2T}} = S_{mc} \text{FACT} / \text{DENOM}$$

$$S_{\text{fl2C}} = S_{mc} / \text{DENOM}$$

$$S_{\text{fl2}} = \frac{[(F_1 - 1 + G_m / G_{\text{fl2}}) F_2 G_{\text{fl2}} S_{ms}]}{G_m F_1} \text{FACT}$$

where  $F_1$  and  $F_2$  are defined by the equations:

$$F_1 = \sqrt{\frac{\pi}{4k_f}}$$

$$F_2 = 1 - \sqrt{\frac{4k_f}{\pi k_m}}$$

The variable **DENOM** is a Fortran variable given by

$$\text{DENOM} = \left[ 1 - \sqrt{k_f} \left( 1 - \frac{E_m}{E_{f22}} \right) \right] \sqrt{1 + \varphi(\varphi - 1) + \frac{1}{3}(\varphi - 1)^2}$$

where  $\varphi$  is given by

$$\varphi = \frac{F_1 - \frac{E_m}{E_{f22}} \left[ 1 - \sqrt{k_f} \left( 1 - \frac{E_m}{E_{f22}} \right) \right]}{F_1 - 1}$$

The Fortran variable **FACT** takes the value  $k_m$  if **IFLAG** is unity. Otherwise **FACT** takes the value unity. This variable is introduced to correlate the strengths of HMS and Kevlar fiber composites with the experimentally observed values. The main program **INHYD** checks for these fibers and assigns the appropriate values for **IFLAG**. **IFLAG** is set at zero for other fibers.

**Moisture diffusivities:**

$$D_{\ell 1} = k_m D_m$$

$$D_{\ell 2} = (1 - \sqrt{k_f}) D_m$$

$$D_{\ell 3} = D_{\ell 2}$$

**Moisture expansion coefficients:**

$$\beta_{\ell 1} = \beta_m k_m E_m / E_{\ell 1}$$

$$\beta_{\ell 2} = \beta_m (1 - \sqrt{k_f}) (1 + k_f \nu_m E_{\ell 1} / E_{\ell 1})$$

$$\beta_{\ell 3} = \beta_{\ell 2}$$

**Flexural moduli ( $E_{\ell 1F}$ ,  $E_{\ell 2F}$ ):**

$$E_{\ell 1F} = E_{\ell 1}$$

$$E_{\ell 2F} = E_{\ell 2}$$

**Flexural Strengths:**

$$S_{\ell 2F} = \frac{\left( F_1 - 1 + \frac{G_m}{G_{f23}} \right) F_2 G_{\ell 23} S_{ms}}{G_m F_1}$$

$$S_{\ell 12F} = 1.5 S_{\ell 12}$$

**Ply thickness:** A default value of 0.005 is set for  $t_\ell$ . This is overridden by the user specified value in the ICAN main program.

**Interply thickness and interfiber spacing:**

$$\delta_f = \left( \sqrt{\frac{\pi}{k_f}} - 2 \right) \frac{d_f}{2}$$

$$\delta_f = \delta_\ell$$

**Subroutine HTM (C, F, M, VF, VM, VV, IFLAG).**—This subroutine generates the hygrothermomechanical properties based on the theory proposed in reference 15. The subroutine is called only if nontrivial entries for the use temperature and the moisture content ( $T_u \neq 70$  °F or nonzero moisture content) are present. The equations programmed are mostly those discussed in the subroutine FIBMT description. Therefore, only the equations which are different are mentioned here.

**Moisture expansion coefficients:**

$$\beta_{\ell 22} = (1 - \sqrt{k_f}) \beta_m \left[ 1 + \frac{\sqrt{k_f}(1 - \sqrt{k_f})E_m}{\sqrt{k_f}E_{\ell 22} + (1 - \sqrt{k_f})E_m} \right]$$

$$\beta_{\ell 33} = \beta_{\ell 22}$$

**Strengths:**

$$S_{\ell 22T} = \left( \frac{S_{mT}}{E_m} \right) \frac{E_{\ell 22} \left( 1 - \sqrt{\frac{4k_v}{\pi k_m}} \right) (1 - \sqrt{k_f})}{1 - \left( \sqrt{k_f}E_{\ell 22} / E_{f22} \right)} \text{FACT}$$

$$S_{\ell 22C} = \left( \frac{S_{mC}}{E_m} \right) \frac{E_{\ell 22} \left( 1 - \sqrt{\frac{4k_v}{\pi k_m}} \right) (1 - \sqrt{k_f})}{1 - \left( \sqrt{k_f}E_{\ell 22} / E_{f22} \right)} \text{FACT}$$

$$S_{\ell 12} = \left( \frac{S_{mS}}{G_m} \right) G_{\ell 12} \frac{\left( 1 - \sqrt{\frac{4k_v}{\pi k_m}} \right) (1 - \sqrt{k_f})}{1 - \left( \sqrt{k_f}G_{\ell 12} / G_{f12} \right)} \text{FACT}$$

$$S_{\ell 23F} = \left( \frac{S_{mS}}{G_m} \right) G_{\ell 23} \frac{\left( 1 - \sqrt{\frac{4k_v}{\pi k_m}} \right) (1 - \sqrt{k_f})}{1 - \left( \sqrt{k_f}G_{\ell 23} / G_{f23} \right)}$$

$$S_{\ell 12}F = 1.5S_{\ell 12}$$

In the preceding equations, FACT is a Fortran variable which is given by

$$\text{FACT} = \delta_s / \delta_f$$

for Kevlar and HMS fibers. For all other fibers  $\text{FACT} = 1$ .

**Subroutine FLEXX (C).**—The entries C(32) and C(33) of the ply property array C are generated in this subroutine. They are, respectively, the longitudinal flexural strength and the transverse flexural strength. The longitudinal flexural strength is given by

$$S_{\ell 1F} = \frac{2.5S_{\ell 1T}}{\left(1 + \frac{S_{\ell 1T}}{S_{\ell 1C}}\right)}$$

The transverse flexural strength is given by

$$S_{\ell 2F} = \frac{2.5S_{\ell 2T}}{\left(1 + \frac{S_{\ell 2T}}{S_{\ell 2C}}\right)}$$

**Subroutine COMPP (IPFLAG, ISFLAG).**—This subroutine is called by INHYD to generate the properties of a hybrid ply. The equations are based on the theory proposed in reference 13. The properties are stored in the array H. The entries are, however, the same as those of array C given in the description for subroutine FIBMT. The inputs to this routine are the primary composite properties array P, the secondary composites property array S, and the percentage of the secondary composite  $k_{sc}$ . The equations are the following:

**Elastic normal moduli:**

$$E_{\ell 1}(H) = E_{\ell 1}(P) + [E_{\ell 1}(S) - E_{\ell 1}(P)]k_{sc}$$

$$E_{\ell 2}(H) = \frac{E_{\ell 2}(P)}{1 + k_{sc}[E_{\ell 2}(P)/E_{\ell 2}(S) - 1]}$$

$$E_{\ell 3}(H) = E_{\ell 3}(P) + [E_{\ell 3}(S) - E_{\ell 3}(P)]k_{sc}$$

**Shear moduli:**

$$G_{\ell 23}(H) = \frac{G_{\ell 23}(P)}{1 - k_{sc}\left(1 - \frac{G_{\ell 23}(P)}{G_{\ell 23}(S)}\right)}$$

$$G_{\ell 12}(H) = \frac{G_{\ell 12}(P)}{1 - k_{sc}\left(1 - \frac{G_{\ell 12}(P)}{G_{\ell 12}(S)}\right)}$$

$$G_{\ell 13}(H) = G_{\ell 13}(P) + k_{sc}[G_{\ell 13}(S) - G_{\ell 13}(P)]$$

**Poisson's ratios:**

$$\nu_{\ell 12}(H) = \nu_{\ell 12}(P) + k_{sc}[\nu_{\ell 12}(S) - \nu_{\ell 12}(P)]$$

$$\nu_{\ell 13}(H) = \nu_{\ell 12}(P) + \frac{k_{sc}[\nu_{\ell 12}(P) - \nu_{\ell 12}(S)]}{(1 - k_{sc})[E_{\ell 33}(P)/E_{\ell 33}(S)] - k_{sc}}$$

$$\nu_{\ell 23}(H) = \nu_{\ell 23}(P) + k_{sc}[\nu_{\ell 23}(S) - \nu_{\ell 23}(P)]$$

**Coefficients of thermal expansion:**

$$\alpha_{\ell 11}(H) = \frac{\alpha_{\ell 11}(P) + k_{sc}[\alpha_{\ell 11}(S)E_{\ell 11}(S)/E_{\ell 11}(P)] - \alpha_{\ell 11}(P)}{1 + k_{sc}\left(\frac{E_{\ell 11}(S)}{E_{\ell 11}(P)} - 1\right)}$$

$$\begin{aligned} \alpha_{\ell 33}(H) = \frac{1}{E_{\ell 33}(H)} & \left\{ -\nu_{\ell 13}(H)E_{\ell 33}(H)\alpha_{\ell 11}(H) + (1 - k_{sc})E_{\ell 33}(P)\left[\alpha_{\ell 22}(P) + \nu_{\ell 13}(P)\alpha_{\ell 11}(P)\right] \right. \\ & \left. + k_{sc}E_{\ell 33}(S)\left[\alpha_{\ell 22}(S) + \nu_{\ell 13}(S)\alpha_{\ell 11}(S)\right] \right\} \end{aligned}$$

$$\begin{aligned} \alpha_{\ell 22}(H) = (1 - k_{sc}) & \left\{ \alpha_{\ell 22}(S)\left[1 + \nu_{\ell 23}(P)\right] + \nu_{\ell 12}(P)\alpha_{\ell 11} \right\} \\ & + k_{sc}\left\{ \alpha_{\ell 22}(S)\left[1 + \nu_{\ell 23}(S)\right] + \nu_{\ell 12}(S)\alpha_{\ell 11}(S) \right\} \end{aligned}$$

$$- \nu_{\ell 12}(H)\alpha_{\ell 11}(H) - \nu_{\ell 23}(H)\alpha_{\ell 33}(H)$$

**Density:**

$$\rho_{\ell}(H) = (1 - k_{sc})\rho_{\ell}(P) + k_{sc}\rho_{\ell}(S)$$

**Heat capacity:**

$$\begin{aligned} C_{\ell}(H) = & \left\{ (1 - k_{sc})[C_f(P)k_f(P)\rho_f(P) + C_m(P)k_m(P)\rho_m(P)] \right. \\ & + k_{sc}[C_f(S)k_f(S)\rho_f(S) + C_m(S)k_m(S)\rho_m(S)] \\ & \left. + [k_f(P)k_{\nu}(P) + k_{sc}k_{\nu}(S)]M\rho_{msl}C_{msl} \right\} / \rho_{\ell}(H) \end{aligned}$$

where  $\rho_{mst}$  and  $C_{mst}$  are the moisture density and heat capacity, respectively.

**Heat conductivities:**

$$K_{\ell 11}(H) = (1 - k_{sc})[k_f(P)K_{\ell 11}(P) + k_m(P)K_m(P)] + k_{sc}[k_f(S)K_{\ell 11}(S) + k_m(S)K_m(S)]$$

$$K_{\ell 22}(P) = \frac{(1 - \sqrt{k_f(P)})K_m(P) + \sqrt{k_f(P)}K_m(P)}{1 - \sqrt{k_f(P)}[1 - K_m(P)/K_{\ell 22}(P)]}$$

$$K_{\ell 22}(S) = \frac{(1 - \sqrt{k_f(S)})K_m(S) + \sqrt{k_f(S)}K_m(S)}{1 - \sqrt{k_f(S)}[1 - K_m(S)/K_{\ell 22}(S)]}$$

$$K_{\ell 22}(H) = \frac{K_{\ell 22}(P)}{1 - k_{sc}[1 - K_{\ell 22}(S)/K_{\ell 22}(P)]}$$

$$K_{\ell 33}(H) = K_{\ell 22}(H)$$

The void conductivity  $K_v$  with moisture content  $M$  is given by  $K_v = MK_{mst}$ . If there are voids in the primary composite,  $K_m(P)$  in the preceding equations for heat conductivities is replaced by

$$K_m(P) = [1 - \sqrt{k_v(P)}]K_m(P) + \frac{\sqrt{k_v(P)}K_m(P)}{[1 - \sqrt{k_v(P)}][1 - K_m(P)/K_v]}$$

Similarly, for the secondary composite,  $K_m(S)$  is replaced by

$$K_m(S) = [1 - \sqrt{k_v(S)}]K_m(S) + \frac{\sqrt{k_v(S)}K_m(S)}{[1 - \sqrt{k_v(S)}][1 - K_m(S)/K_v]}$$

**Strengths.**—The longitudinal strengths are based on the rule of mixtures:

$$S_{\ell 11T}(H) = S_{\ell 11T}(P)(1 - k_{sc}) + S_{\ell 11T}(S)k_{sc}$$

$$S_{\ell 11C}(H) = S_{\ell 11C}(P)(1 - k_{sc}) + S_{\ell 11C}(S)k_{sc}$$

The following are a few intermediate variables defined for convenience in the evaluation of transverse strengths:

$$Q_p = 1 - 2\sqrt{k_v(P)/\pi} [1 - 2\sqrt{k_f(P)/\pi}]$$

$$Q_s = 1 - 2\sqrt{k_v(S)/\pi} [1 - 2\sqrt{k_f(S)/\pi}]$$

$$S_{mC} = \min[S_{mC}(P) \text{ and } S_{mC}(S)]$$

$$S_{mT} = \min[S_{mT}(P) \text{ and } S_{mT}(S)]$$

$$S_{mS} = \min[S_{mS}(P) \text{ and } S_{mS}(S)]$$

$$\text{FACT 1} = k_m(P) \quad (\text{for HMS and Kevlar fibers})$$

$$\text{FACT 2} = k_m(S) \quad (\text{for HMS and Kevlar fibers})$$

$$\text{FACT 1} = \text{FACT 2} = 1 \quad (\text{for all other fibers})$$

$$S_{f22}(P) = \frac{(1 - k_{sc})Q_p/E_{P22}(P) \left[ 1 - \sqrt{\frac{k_f(P)}{\pi}} \left( 1 - \frac{E_m(P)}{E_{f22}(P)} \right) \right]}{1 - \sqrt{k_f(P)} \left( 1 - \frac{E_m(P)}{E_{f22}(P)} \right)} S_m(P)$$

$$S_{f22}(S) = \frac{\frac{k_{sc}Q_s}{E_{f22}(S)} \left[ 1 - \sqrt{\frac{k_f(S)}{\pi}} \left( 1 - \frac{E_m(S)}{E_{f22}(S)} \right) \right]}{1 - \sqrt{k_f(S)} \left( 1 - \frac{E_m(S)}{E_{f22}(S)} \right)} S_m(S)$$

$$\varphi_p = \frac{\sqrt{\frac{\pi}{4k_f(P)}} - \frac{E_m(P)}{E_{f22}(P) \left[ 1 - \sqrt{k_f(P)} \left( 1 - \frac{E_m(P)}{E_{f22}(P)} \right) \right]}}{\sqrt{\frac{\pi}{4k_f(P)}} - 1}$$

$$\varphi_s = \frac{\sqrt{\frac{\pi}{4k_f(S)}} - \frac{E_m(S)}{E_{f22}(S) \left[ 1 - \sqrt{k_f(S)} \left( 1 - \frac{E_m(S)}{E_{f22}(S)} \right) \right]}}{\sqrt{\frac{\pi}{4k_f(S)}} - 1}$$

$$\text{DENOMP} = 1 - \sqrt{k_f(P)} \left( 1 - \frac{E_m(P)}{E_{f22}(P)} \right) \sqrt{1 + \varphi_p(\varphi_p - 1) + \frac{1}{3}(\varphi_p - 1)^2}$$

$$\text{DENOMS} = 1 - \sqrt{k_f(S)} \left( 1 - \frac{E_m(S)}{E_{f22}(S)} \right) \sqrt{1 + \varphi_s(\varphi_s - 1) + \frac{1}{3}(\varphi_s - 1)^2}$$

The transverse and the shear strengths of hybrid composites are given by

$$S_{\ell 22T}(H) = E_{\ell 22}(H) \left[ \frac{(1 - k_{sc}) \text{FACT1}}{E_{\ell 22}(P) \text{DENOMP}} + \frac{k_{sc} \text{FACT2}}{E_{\ell 22}(S) \text{DENOMS}} \right] S_{mT}$$

$$S_{\ell 22C}(H) = E_{\ell 22}(H) \left[ \frac{(1 - k_{sc})}{E_{\ell 22}(P) \text{DENOMP}} + \frac{k_{sc}}{E_{\ell 22}(S) \text{DENOMS}} \right] S_{mC}$$

$$S_{\ell 12}(H) = \frac{2G_{\ell 12}}{\pi} \left\{ \frac{\frac{(1 - k_{sc})Q_p}{G_{\ell 12}(P)} \text{FACT1} \left[ 1 - \sqrt{\frac{k_f(P)}{\pi}} \left( 1 - \frac{G_m(P)}{G_{\ell 12}(P)} \right) \right]}{1 - \sqrt{k_f(P)} \left( 1 - \frac{G_m(P)}{G_{\ell 12}(P)} \right)} \right. \\ \left. + \frac{\frac{k_{sc}Q_s}{G_{\ell 12}(S)} \text{FACT2} \left[ 1 - \sqrt{\frac{k_f(S)}{\pi}} \left( 1 - \frac{G_m(S)}{G_{\ell 12}(S)} \right) \right]}{1 - \sqrt{k_f(S)} \left( 1 - \frac{G_m(S)}{G_{\ell 12}(S)} \right)} \right\} S_{mS}$$

**Moisture diffusivity:**

$$D_{\ell}(P) = \frac{1 - \sqrt{k_{\nu}(P)} + k_{\nu}(P)}{[1 - \sqrt{k_f(P)}]D_{\ell}(P)}$$

$$D_{\ell}(S) = \frac{1 - \sqrt{k_{\nu}(S)} + k_{\nu}(S)}{[1 - \sqrt{k_f(S)}]D_{\ell}(S)}$$

$$D_{\ell 1}(H) = (1 - k_{sc})k_m(P)D_{\ell}(P) + k_{sc}k_m(S)D_{\ell}(S)$$

$$D_{\ell 2}(H) = (1 - k_{sc}) \left[ 1 - 2\sqrt{k_f(P)} \right] D_{\ell}(P) + k_{sc} \left[ 1 - \sqrt{k_f(S)} \right] D_{\ell}(S)$$

$$D_{\ell 3}(H) = D_{\ell 2}(H)$$

**Moisture expansion coefficients:**

$$\beta_{\ell 11}(P) = \frac{k_m(P)\beta_m(P)E_m(P)}{k_f(P)E_{f11}(P) + k_m(P)E_m(P)}$$

$$\beta_{\ell 11}(S) = \frac{k_m(S)\beta_m(S)E_m(S)}{k_f(S)E_{f11}(S) + k_m(S)E_m(S)}$$

$$\beta_{\ell 22}(P) = \beta_m(P) \left[ 1 - \sqrt{k_f(P)} \right] \left\{ 1 + \frac{k_f(P)k_m(P)E_{f11}(P)}{E_{f11}(P) + k_m(P)[E_m(P) - E_{f11}(P)]} \right\}$$

$$\beta_{\ell 22}(S) = \beta_m(S) \left[ 1 - \sqrt{k_f(S)} \right] \left\{ 1 + \frac{k_f(S)k_m(S)E_{f11}(S)}{E_{f11}(S) + k_m(S)[E_m(S) - E_{f11}(S)]} \right\}$$

$$\beta_{\ell 11}(H) = \frac{[(1 - k_{sc})k_m(P)\beta_m(P)E_m(P) + k_{sc}k_m(S)\beta_m(S)E_m(S)]}{E_{\ell 11}(H)}$$

$$\begin{aligned} \beta_{\ell 33}(H) = & \left\{ -\nu_{\ell 13}(H)E_{\ell 33}(H)\beta_{\ell 11}(H) + (1 - k_{sc})E_{\ell 33}(P)[\beta_{\ell 22}(P) + \nu_{\ell 13}(P)\beta_{\ell 11}(P)] + k_{sc}E_{\ell 33}(S)[\beta_{\ell 22}(S) \right. \\ & \left. + \nu_{\ell 13}(S)\beta_{\ell 11}(S)] \right\} / E_{\ell 33}(H) \end{aligned}$$

$$\nu_{\ell 12}(P) = \nu_m(P) + k_f(P)[\nu_{f12}(P) - \nu_m(P)]$$

$$\nu_{\ell 12}(S) = \nu_m(S) + k_f(S)[\nu_{f12}(S) - \nu_m(S)]$$

$$\nu_{\ell 32}(P) = \nu_m(P) + k_f(P)[\nu_{f23}(P) - \nu_m(P)]$$

$$\nu_{\ell 32}(S) = \nu_m(S) + k_f(S)[\nu_{f23}(S) - \nu_m(S)]$$

$$\begin{aligned} \beta_{\ell 22}(H) = & (1 - k_{sc})[\beta_{\ell 22}(P)(1 + \nu_{\ell 22}(P)) + \nu_{\ell 12}(P)\beta_{\ell 11}(P)] + k_{sc}[\beta_{\ell 22}(S)(1 + \nu_{\ell 22}(S)) \\ & + \nu_{\ell 12}(S)\beta_{\ell 11}(S)] - \nu_{\ell 12}(H)\beta_{\ell 11}(H) - \nu_{\ell 23}(H)\beta_{\ell 33}(H) \end{aligned}$$

### Flexural moduli:

$$E_{\ell 11F}(H) = E_{\ell 11}(H)$$

$$E_{\ell 22F}(H) = E_{\ell 22}(H)$$

### Flexural strengths:

$$S_{\ell 23F}(H) = \frac{2G_{\ell 23}(H)}{\pi} \left\{ \frac{\frac{(1 - k_{sc})Q_p}{G_{\ell 23}(P)} \left[ 1 - \sqrt{\frac{k_f(P)}{\pi}} \left( 1 - \frac{G_m(P)}{G_{\ell 23}(P)} \right) \right]}{1 - \sqrt{k_f(P)} \left( 1 - \frac{G_m(P)}{G_{\ell 23}(P)} \right)} \right. \\ \left. + \frac{k_{sc}Q_s}{G_{\ell 23}(S)} \frac{\left[ 1 - \sqrt{\frac{k_f(S)}{\pi}} \left( 1 - \frac{G_m(S)}{G_{\ell 23}(S)} \right) \right]}{1 - \sqrt{k_f(S)} \left( 1 - \frac{G_m(S)}{G_{\ell 23}(S)} \right)} \right\} S_m(S)$$

$$S_{\ell 12SB}(H) = 1.5S_{\ell 12}(H)$$

**Fiber volume ratio:**

$$k_f(H) = k_f(P) + k_{sc}[k_f(S) - k_f(P)]$$

**Subroutines BANKRD and IDGER.**—These two subroutines do preprocessing to generate compatible input data to the subroutine INHYD. The subroutine BANKRD is called first by the ICAN main program. The input to this routine is primarily the data supplied on the material card MATCRD by the user. These cards indicate the coded names for the fiber and matrix, the volume ratios of primary and secondary composites, and their respective fiber, and the matrix and void volume ratios. The subroutine BANKRD has its own data base containing the properties of fibers and matrices of commonly used materials. This data base is assigned to input unit 8. It is named FBMTDATA.BANK. The output of BANKRD are the arrays PFP, PFS, PMP, and PMS. The entries in PFP and PFS are the fiber properties of primary and secondary composites. The entries in PMP and PMS are the matrix properties of primary and secondary composites. These arrays are made common to the main program and the subroutine IDGER through the labeled common block MFBANK. The entries of PF and PM arrays are explained in the following list:

Fiber Property Arrays PFP and PFS

Entry	Description	Notation
1	not used	----
2	fiber density	$\rho_f$
3	normal moduli	$E_{f11}$
4	normal moduli	$E_{f22}$
5	Poisson's ratio	$\nu_{f12}$
6	Poisson's ratio	$\nu_{f23}$
7	shear moduli	$G_{f12}$
8	shear moduli	$G_{f23}$
9	thermal expansion coefficient	$\alpha_{f11}$
10	thermal expansion coefficient	$\alpha_{f22}$
11	heat conductivity	$K_{f11}$
12	heat conductivity	$K_{f22}$
13	heat capacity	$C_f$
14	strengths	$S_{fT}$
15	strengths	$S_{fC}$
16	not used	----
17	not used	----
18	not used	----
19	not used	----
20	number of fibers per end	$N_f$
21	fiber diameters	$d_f$

## Matrix Property Arrays PMP and PMS

Entry	Description	Notation
1	not used	----
2	density	$\rho_m$
3	normal modulus	$E_m$
4	Poisson's ratio	$\nu_m$
5	coefficient of thermal expansion	$\alpha_m$
6	heat conductivity	$K_m$
7	heat capacity	$C_m$
8	tensile strength	$S_{mT}$
9	compressive strength	$S_{mC}$
10	shear strength	$S_{mS}$
11	allowable tensile strain	$\epsilon_{mT}$
12	allowable compressive strain	$\epsilon_{mC}$
13	allowable shear strain	$\epsilon_{mS}$
14	allowable torsional strain	$\epsilon_{mTOR}$
15	void conductivity	$K_v$
16	glass transition temperature	$T_{gdr}$

The coded names for the fiber and matrix are stored in the matrix CODES by the main program. The entries in CODES are explained as follows:

CODES(1,1,I)	coded name of primary fiber
CODES(1,2,I)	coded name of primary matrix
CODES(2,1,I)	coded name of secondary fiber
CODES(2,2,I)	coded name of secondary matrix

The subroutine IDGER takes the information generated by BANKRD and arranges it in a proper format for the subroutine INHYD. These data are transferred to input unit 7 prior to calling INHYD. These data are purged at the end of the program execution.

### Data Base FBMTDATA.BANK.

The constituent properties data base is a unique feature of the computer code ICAN. Its primary aim is to reduce the burden on the user by preparing properly formatted data for the program. The user only needs to specify the coded names for the fiber and matrix. The format of the data is explained in this section so as to enable the user to introduce new contents or to modify existing entries as appropriate to his/her needs. Data for four fibers and three matrices are provided in the present package.

The fiber properties are arranged in five physical cards of 80 column length. The first card contains a four-character code name of a fiber in format A4. The second to the fifth cards start with a two-letter mnemonic to indicate the type of properties that follow. The format on any of these cards is A4, 7E10.3, except for the second card. The second card is in the format A3, I6, 7E10.3. The mnemonics FP, FE, FT, and FS stand for fiber physical, elastic, thermal, and strength-related properties, respectively. The entries on these cards are explained as follows:

- card 1 four character coded name for fiber
- card 2 FP;  $N_f, d_f, \rho_f$
- card 3 FE;  $E_{f11}, E_{f22}, \gamma_{f12}, \gamma_{f23}, G_{f12}, G_{f23}$
- card 4 FT;  $\alpha_{f11}, \alpha_{f22}, K_{f11}, K_{f22}, C_f$
- card 5 FS;  $S_{fT}, S_{fC}$  (The remaining entries are open for future modifications.)

The matrix properties are arranged next after the line OVER END OF FIBER PROPERTIES. The properties have essentially the same format as those for fiber property cards. There are, however, six physical cards for each matrix material. The mnemonics used are MP, ME, MT, MS, and MV. They stand for matrix physical, elastic, thermal, strength-related, and miscellaneous properties, respectively. The format for the first card is A4, and the format for the rest of the cards is A3, 7E10.3. The entries in each card are as follows:

- card 1 four character coded name for matrix
- card 2 MP;  $\rho_m$
- card 3 ME;  $E_m, \nu_m, \alpha_m$
- card 4 MT;  $K_m, C_m$
- card 5 MS;  $S_{mT}, S_{mC}, S_{mS}, \epsilon_{mT}, \epsilon_{mC}, \epsilon_{mS}, \epsilon_{mTOR}$
- card 6 MV;  $K_v, T_{gdr}$

The data base presently contains properties for T-300 (T300), AS graphite (AS--), S-Glass (SGLA), and HMS (HMSF) fibers. The available matrix materials are high-modulus, high-strength (HMHS), intermediate-modulus, high-strength (IMHS), and intermediate-modulus, low-strength (IMLS) matrices, which are epoxy-type resins. The complete list of properties is shown in appendix C.

## Appendix A

### List of Code Identifiers

Engineering symbol	Fortran symbol code	Comment
$A_{cx}$	ACX	composite axial stiffness; generated in subroutine GPCFD2
$A_{cx}^R$	RAC	reduced axial stiffness; computed in subroutine GPCFD2
BIDE	Boolean	true if interply effects are included; input
$C_{cx}$	CPC	composite coupling stiffness; generated in subroutine GPCFD2
$C_{e1}$	RESF	string with force variables in BLOCK DATA
$C_{e2}$	DISP	string with displacement variables in BLOCK DATA
COMSAT	Boolean	true if COMSA is executed; input
CSANB	Boolean	true if membrane and bending symmetry exists; input
$D_{cx}$	FTC	composite flexural rigidities; generated in subroutine GPCFD2
$D_{cx}^R$	RDC	reduced bending rigidities; computed in subroutine GPCFD2
$D_f$	DIAF	filament equivalent diameter; input
$D_v$	DISV, DISVI	displacement vectors; DISVI is either read in main program, or is generated in subroutine COMSA
$E_f, E_{cf}$	ECF	filament elastic constants; input
$E_{f11, \ell11, m11}$	EF11,EL11,EM11	filament, ply, and matrix normal moduli; filament and matrix moduli input
$G_{f12, \ell12, m11}$	EF12,EL12,EM12	filament, ply, and matrix shear moduli; filament and matrix shear moduli input
$E_\ell E_{cl}$	ECL	ply elastic constants; generated in subroutine INHYD
$E_m, E_{cm}$	ECM	matrix elastic constants; generated in subroutine INHYD
$H_j$	PL(9,I)	interply distortion energy coefficient; generated in main program
$H_{kc}$	CHK	array of constituent heat conductivities; input
$h_c$	HHC	composite heat capacity stored in PC(18) and PC(54)
$i, j$	I,J	index; generally ply or interply
$K_{cxx, cyy, cxy}$	HK11,22,33	composite two-dimensional heat conductivities in PC(51) to PC(53)
$K_{c11, c22, c33}$	HK11,22,33	composite three-dimensional heat conductivities along the material axes in, PC(15) to PC(17)
$K_{f,v}$	KF,V	apparent fiber and void volume ratios; input
$K_{f11, \ell11, m11}$	CHK	see $H_{kc}$
$K_{1xx, 1yy, 1xy}$	XK1,XK2,XK3	stress concentration factors generated in STRCNF
$k_{f,m}$	KFB,MB	actual fiber and matrix volume ratios
$k_{f\ell, v\ell}$	KFL,VL	ply apparent fiber and void volume ratios
$L_{sc}$	LSC	array of limiting conditions; input
$M_{cx}$	MBS	applied moment; input
$M_{cT_{\ell x}}$	MSDT	thermal moments; generated in GPCFD2
$M_{cM_{\ell x}}$	MSDH	hygral moments; generated in GPCFD2
$m$	M	load condition index
$N_{cx}$	NBS	applied membrane loads; input
$N_{cM_{\ell x}}$	NSDH	hygral force; generated in GPCFD2
$N_{cT_{\ell x}}$	NSDT	thermal force; generated in GPCFD2
$N_f$	NFPE	number of filaments per end; input
$N_\ell$	NL	number of plies; input

$N_{lc}$	NLC	number of load conditions; input
$N_{ms}$	NMS	number of material systems; input
$N_{pc}$	NPC	string PROPC length; input
$N_{pl}$	NPL	string PROP length; input
NONUDF	Boolean	T (true) if Poisson's ratio difference chart is to be suppressed
$P_c$	PC	composite properties array; generated in GACD3 and GPCFD2
$P_{cp}$	PROPC	string PROPC; composite property identifiers in GDCFD2
$P_\ell$	PL	ply property array; portions generated in all parts of the program
$P_{\ell p}$	PROP	string PROP; ply properties identifiers in main program
$Q_{f,i,p,r,s}$	QF,I,P,R,S	indices to print out string PROP
$R$	R	transformation matrix; GACD3, GPCFD2, and COMSA
RINDV	Boolean	T (true) if displacements are read in; input
$S_{\ell 1T}$ ,etc.	PL(51) to PL(59,I)	ply limit stresses; generated in GLLSC
$t_\ell$	TL	ply thickness; input
$w_{cb}$	$w_{xx}$	composite local curvatures relative to the structural axes
$\alpha_c$	CTE	composite coefficient of thermal expansion; three-dimensional in PC(12) to PC(14), two-dimensional in PC(48) to PC(50)
$\alpha_{f,\ell,m}$	VAF,AL,AM	filament, ply, and matrix thermal coefficients of expansion; input
$\beta_{e,\nu e}$	VCF	correlation factors for ply thermoelastic properties and strain magnification factors; set to unity in COMSA
$\beta_h$	BTA	correlation factors for ply heat conductivity; set to unity in COMSA
$\beta_s$	BET	correlation factors for ply strength; set to unity in COMSA
$\delta_\ell$	PL(8,I)	interply layer thickness; generated in INHYD
$\epsilon_{csx}$	UX	reference plane membrane strain; solved in terms of $N_{cx}$ or input
$\epsilon_\ell$	EPS,PL(74) to PL(66,I)	ply strains; generated in COMSA
$\theta_{cs}$	THCS	angle between composite material and structural axes; input
$\theta_{\ell}, \theta_{\ell c}$	THLC	angle between ply material and composite axes; input
$\nu_{f12}, \nu_{12}, m_{12}$	NUF12,L12,M12	filament, ply, and matrix Poisson's ratios; input
$\pi$	PIE	constant; input
$\rho_{f,m,\ell}$	RHOF,M,L	filament and matrix weight density; input and generated in FIBMT, HTM, and COMPP
$\sigma_f, \sigma_m$	SF, SM	microstresses in fibers and matrices generated in MCRSTR
$\ell_i$	XPL,XSL,YPL,YSL	boundary zone decay length; generated in the main program and paired to EDGSTR
$\sigma_\ell$	SIGL,PL(67) to PL(69,I)	ply stress; generated in COMSA

NOTE: THE INTERLAMINAR STRESSES ARE BETWEEN PLIES (I-1) AND (I).  
 NOTE: IF THE PLY NO IS REPEATED THEN THE SECOND ONE INDICATES STRESSES IN THE SECONDARY COMPOSITE.  
 NOTE: FOR ANGLE PLY LAMINATES SIGYY IS 0. CONSEQUENTLY SIGZY AND SIGZZ ARE COMPUTED AS ZERO.  
 TO OBTAIN NONTRIVIAL SIGZY AND SIGZZ, ONE MUST SPECIFY A THIN INTERPLY LAYER.  
 THE INTERPLY LAYER THICKNESS MAY BE OBTAINED FROM THE PLY PROPERTY TABLE.

Item 15(a)

M I C R O S T R E S S E S

FOR LOAD CONDITIONS  
 MEMBRANE LOADS NBS(X,Y,XY-M) ARE 1000. 0. 0.  
 BENDING LOADS MBS(X,Y,XY-M) ARE 0. 0. 0.  
 QXZ, QYZ AND APPLIED PRESSURES ARE 0. 0. 0.  
 NOTE : NO MOISTURE OR TEMPERATURE

(NOTE: ROWS-PROPERTY, COLUMNS-LAYER)

STRESSES ARE IN POUNDS/INCH SQ.

EXPLANATION OF THE INFLUENCE COEFFICIENTS

NX,NY AND NXY ARE UNIT LOADS IN LB/INCH. MX,MY AND MXY  
ARE UNIT MOMENTS IN LB.IN/INCH. DELTAT IS A UNIT TEMP.  
DIFF. AND DELTAM IS A UNIT PERCENTAGE OF MOISTURE CONTENT.  
TO OBTAIN RESPONSE R FOR A GENERAL APPLIED LOAD  
VECTOR F USE THE FOLLOWING EQUATION:

$$(R) = (A_{INF}) \times (F)$$

NOTE: R IS A 6X1 COLUMN VECTOR DEFINED BY

$$(R) = (EPS11 \ EPS22 \ EPS12 \ SIG11 \ SIG12 \ SIG12)^T$$

F IS A 8X1 COLUMN VECTOR DEFINED BY

$$(F) = (NX \ NY \ NXY \ MX \ MY \ MXY \ DELTAT \ DELTAM)^T$$

AINF IS A (6X8) MATRIX CONTAINING THE INFLUENCE

COEFFICIENTS ARRAYS.

NOTE: THE MEMBRANE STRESSES ARE NORMALIZED W.R.T THE  
AVERAGE STRESS DUE TO UNIT LOAD IN AN EQUIVALENT  
HOMOGENEOUS SECTION. THE BENDING STRESSES ARE  
NORMALIZED W.R.T THE MAXIMUM STRESS DUE TO UNIT  
MOMENT. THE TEMPERATURE AND MOISTURE STRESSES ARE  
NORMALIZED W.R.T THE AVERAGE STRESSES DUE TO UNIT  
TEMPERATURE DIFFERENCE AND UNIT PERCENTAGE OF MOIS-  
TURE. TO OBTAIN THE ABSOLUTE VALUES OF THE STR-  
ESES THE INFLUENCE COEFFICIENTS SHOULD BE MULTI-  
PLIED BY THE INDICATED SCALE FACTORS. THESE SHOULD  
BE MULTIPLIED BY THE CORRESPONDING LOADS TO OBTAIN  
STRESSES IN THE PLIES.

16. Abstract This manual describes the use of and relevant equations programmed in a computer code designed to carry out a comprehensive linear analysis of multilayered fiber composites. The analysis contains the essential features required to effectively design structural components made from fiber composites. The program is an out-growth of two in-house computer codes, MFCA (Multilayered Filamentary Composite Analysis) and INHYD (Intraply Hybrid Composite Design). The inputs to the code are constituent material properties, factors reflecting the fabrication process, and composite geometry. The code performs micromechanics, macromechanics, and laminate analysis, including the hygrothermal response of fiber composites. The code outputs are the various ply and composite properties, composite structural response, and composite stress analysis results with details on failure. The code is in Fortran IV and can be used efficiently as a package in complex structural analysis programs. The input-output format is described extensively through the use of a sample problem. The program listing is also included. The code manual consists of two parts. The mechanics for using the code are described in the first part, the pertinent equations programmed in the code are described in the second part.
